カンデル神経科学(Principles of Neural Science) <https://www.medsci.co.jp/kandel/syousai/index.html>

主にMeissnerとPacinianが関与。

ただし振動子が小さいとPaciniの「空間加算」効果が無くなり、高周波を感じなくなる

Vibration is coded by Meissner + Pacinian. If the vibrator size is small, high freq. threshold rises, (“spatial summation effect” of Pacinian corpuscle)

(EuroHaptics2016) Temporal integration of tactile inputs from multiple sites

Sarah McIntyre, Ingvars Birznieks, Robin Andersson, Gabriel Dicander, Paul Breen, Richard Vickery

異なる二箇所に振動を与える。振動の周波数は同じで位相をずらす。これは脳にとっては例えば2倍の周波数に感じられないかという研究→非常に近い時は当然2倍近くに感じる。しかし腕の場合16cmくらい離れていても結構高い周波数に感じる。これは振幅を小さくしても同じなので、機械的に伝わったためとは考えにくい。

Simultaneously presenting vibration to two sites elicit “doubled” frequency feeling, although the positions are quite separated.

(EuroHaptics2016) Frequency-Specific Masking Effect by Vibrotactile Stimulation to the Forearm, Yoshihiro Tanaka, Shota Matsuoka, Wouter Bergmann Tiest, Astrid Kappers, Kouta Minamizawa, Akihito Sano

指先に閾値より少し上の振動を与えておき, 腕にやや強い振動を与えると指先の感覚が完全に消えてしまう. 異なる周波数ではこれは生じない. 劇的に消えるので面白い.

機械受容器につながる多くの神経：A β 繊維、一部A γ 繊維

- 高速に情報を伝えるMyelinatedな神経

C繊維：Unmyelinatedな神経。伝達速度が遅い。

- 温度感覚：A γ 繊維とC繊維
- 痛覚：A γ 繊維とC繊維（緊急の痛みと鈍痛）
- 無毛部のMeissner小体に入り込む繊維：数本C繊維が存在。
- 有毛部にも機械的変形に応答するC繊維が存在。情動に関与？

温度感覚と神経の種類 / Temperature & nerve

Table 7-2 Sets of Afferents Sensitive to Temperature

侵害性冷覚

冷覚

温覚

侵害性温覚

| Group | Axon | Threshold (°C) | Range (°C) |
|--------------|---|----------------|----------------------------|
| Noxious cold | <u>C-fibers</u> , 0.5–2.0 m/sec, rare | 26–27 | Down to tissue destruction |
| Cooling | <u>A-delta</u> , 13–15 m/sec, density 50–70 fibers/cm ² | 34 | 34–26 |
| Warming | <u>C-fibers</u> , 0.5–2.0 m/sec, density 50–70 fibers/cm ² | 36 | 36–42 |
| Noxious heat | (1) <u>C-fibers</u> , 0.2–2.0 m/sec | 42 | 42–52 |
| | (2) <u>A-delta-I</u> | 42 | 42–52 |
| Extreme heat | <u>A-delta-II</u> , rare | 52 | Up to tissue destruction |

神経の種類と伝導速度: Aδ神経は13-15m/s, C繊維0.5-2m/s.

C繊維は圧倒的に遅い

温度感覚神経の伝達速度はなぜそれぞれ異なるのか?

おそらく可能な説明:

- 冷覚: 「触った瞬間の温度変化」から, 材質感を判定 ⇒ 素早いAδが必要
- 侵害性冷覚・温覚: 「環境の温度」から, その場を離れるかどうかを判断 ⇒ 遅いC
- 侵害性温覚: 熱い火, 直射日光等を避ける ⇒ 素早いAδ
- Moderate cool sensation is used for material identification, which requires fast response (Aδ). Noxious cold is environmental, and does not need to be quick. Noxious heat might be used to avoid sun?

どうやって調べる: 神経活動

How we know?: nerve activity

By using needle, we can directly measure nerve activities. Vallbo, "Sensations evoked from the glabrous skin of the human hand by electrical stimulation of unitary mechanoseisitive afferents," Brain Res., 1981.

Procedure

(Medical Doctor's License Required)

(0) See where the nerve bundle is. (by ultrasonography)

(1) Insert a needle ($\phi 0.1\text{mm}$), which is connected to Amp&Speaker

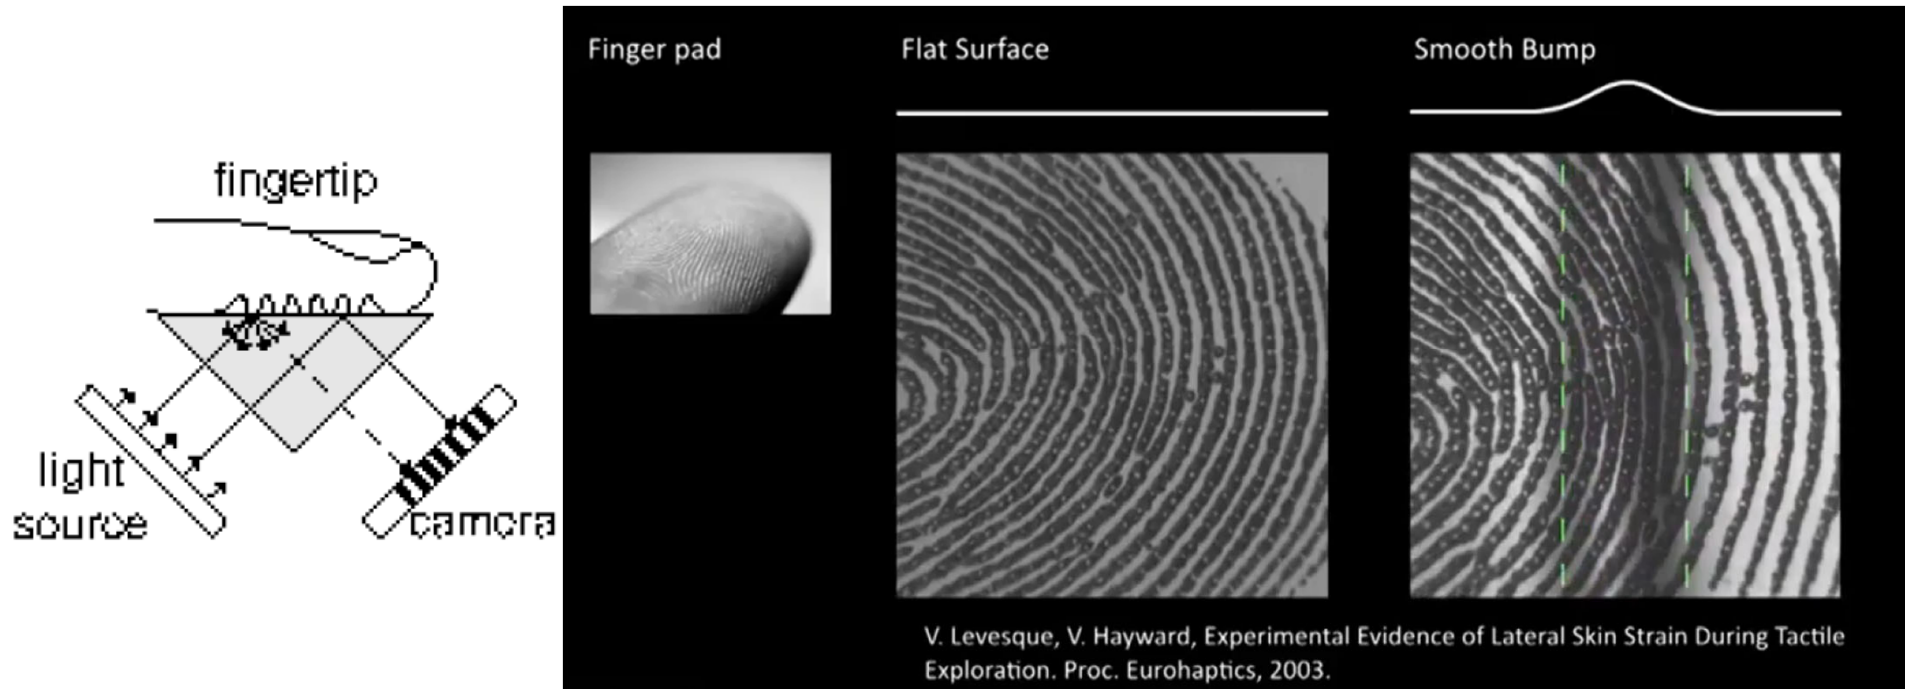

(2) Identify Location and Type of Receptor by the Sound.

(3) Do Experiment on that Location.

静電気型触力覚提示装置で柔らかさ感をなるべく簡単な機構で出す手法を考案

「形」をより細かく提示する

How to produce High-resolution Tactile display?

- これまで実はことごとく、「指一本全体」に対して触感を提示するもの。
- (意地悪に言うなら)高性能な力覚提示装置(PHANToM)で出せる感覚を, wearable化, portable化した, と見ることもできる。
- もし遠隔操縦を人が操るレベルで行うなら、指先皮膚の中の空間的な分布が提示できないといけない。
- Until here, most tactile displays are for “the whole finger”, but higher-resolution tactile information is required for precision tasks.

(おそらく今唯一)入手可能な高分解能, 広帯域触覚ディスプレイ

- 皮膚の水平駆動の重要性に着目して作成されたもの。
- 結果としてシンプルなピエゾアクチュエータの配置が可能となり, 高密度化も可能に。
- Horizontal Vibration is achieved by piezo drive. High density and compact system is achieved by this simple structure.

Simple Actuation by Heating Wire

Fukuyama (2009) Tactile display using the vibration of SMA wires and the evaluation of perceived sensations

- Very thin Nichrome wire can be elongated by heating. Can also quickly shrink.
- Similar phenomenon observed by SMA wire, but not necessarily SMA.
- Heating phenomenon = Smaller the quicker. Good for small tactile display

電気刺激：高時空間分解能，省スペース，低コスト/ Electrotactile display can be high-resolution at low cost

- でも電気といえばビリビリ。
- その理由は物理的相互作用による計算プロセス(皮膚が接触で変形して感覚受容器が活動)を飛ばして受容器活動を生じさせているため。
- 逆に言えば，電気刺激を自然な触感とするためには，物理的な相互作用をすべて理解，モデル化している必要があり，研究課題として魅力的。
- Small, robust, no mechanical resonance, no noise, low power.
- Yet, many consider *Electrical Shock* not appropriate for daily use.

How to overcome *Electrical-Shock* impression, and achieve natural sensation? Tactile Primary Color Approach

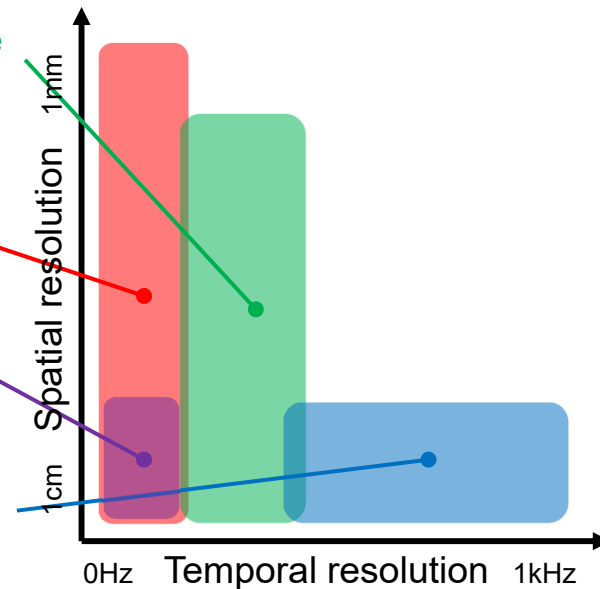

Meissner corpuscle
(low freq. vibration)

Merkel cell
(pressure)

Ruffini ending
(shear deformation)

Pacinian corpuscle
(high freq. vibration)

In vision, primary colors (RGB) are related to receptors' characteristics.
If we selectively stimulate each type of receptors, we can use them as primary colors.

電気刺激は、その極性(陽極, 陰極)を替えることで、
浅部受容器を(ある程度)選択刺激できる

Selective stimulation is possible by changing polarity

- **Large** electrode can stimulate deeper nerves → Vibration sensation
- Small electrode with **cathode** can stimulate Merkel → Pressure sensation
- Small electrode with **anode** can stimulate Meissner → Texture sensation

原因：浅部における軸索の走行？

Possible reason: nerve pathway and boundary conditions?

Merkel: 皮膚水平に走行

Meissner: 皮膚垂直に走行

通常の神経電気刺激は陰極を用いることで神経軸索に正しい方向で「充電」されるが、指先末梢の神経は受容器ごとに走行、電氣的境界条件に特徴がある。

Although normal electrical stimulation uses a cathode to "charge" the nerve axons, the peripheral nerves of the fingertips are characterized by pathways and electrical boundary conditions of each receptor.
