人間計測手法／Measuring Human

意志から行動までの「どの経路を測るか」で5つの段階
Five layers, *from our initial will to our perception.*

- 脳活動計測／Measure **brain activity**.
- 神経・筋活動計測／Measure **nerve activity**.
- 自律神経系計測／Measure **autonomic nerve** related phenomenon.
- 運動計測／Measure **motion**.
- 心理物理実験／Ask the user (**psychophysics**)

Psychophysics

- Measure relationship between subjective sensation and physical stimulation.
 \doteq Measure Human's sensing "ability".
- Important value: "Discrimination threshold"
 - Limitation of "difference of two stimuli" **ΔP** , which is perceptible
ex)
 - $P=30g \Rightarrow \Delta P=3g$
 - $P=3kg \Rightarrow \Delta P=300g$
- Weber-Fechner's law (1834)
 - **$\Delta P/P = \text{Constant}$**
Can be applied to most sensation.

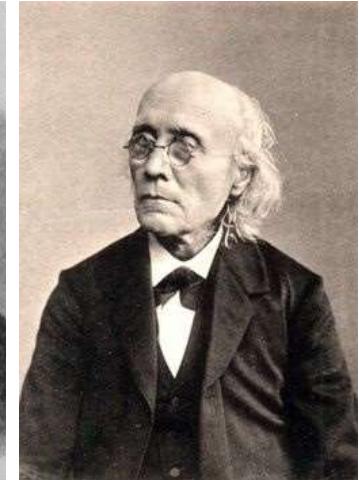

Weber-Fechner's Law

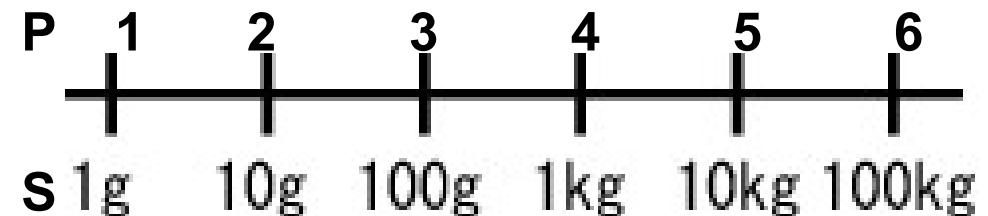

- $P=P(S)$
 - P: subjective value of sensation
 - S: physical value of stimulation
 - ΔP = subjective “scale” of sensation
- $\Delta P/P = \text{Constant}$
 - Integral of both sides gives
 $S \propto \log P$

Weber
(1795~1878)

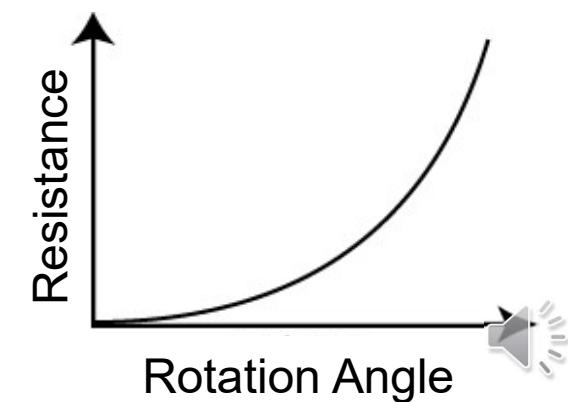

Fechner
(1801~1887)

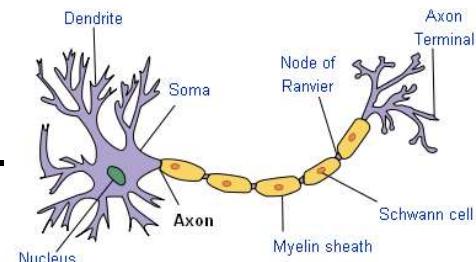

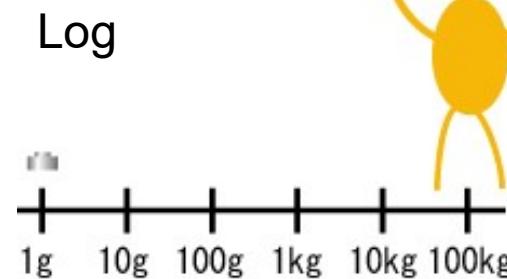

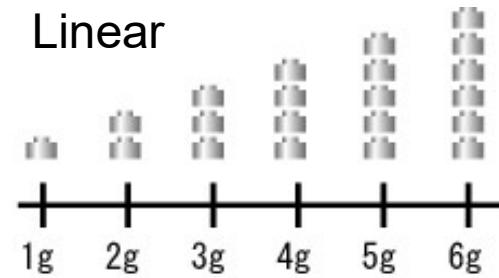

- Conclusion: Our internal “scale” is logarithmic

- ex:
 - Audio’s rotary volume

Why Log? Why not Linear?

Our nerve quantizes the phenomenon by impulses.
When we have only 6 scales...

By using Log scale, we can perceive more phenomena.

(ex) CCD cam: 20dB~30dB
Huma Eye: 80dB(Can see stars and sun)

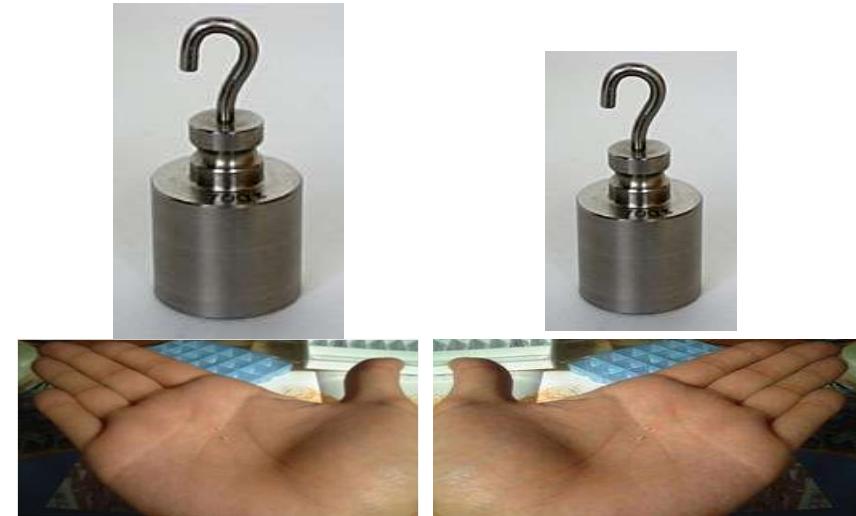

Method of Psychophysical experiment

Purposes

- Measure “Discrimination Threshold” (DT), which gives ΔP
- Measure “Point of Subjective Equality” (PSE).
 - Perceive two different stimuli as “same”.

Discrimination Threshold (DT)
= What is the necessary difference
for discrimination

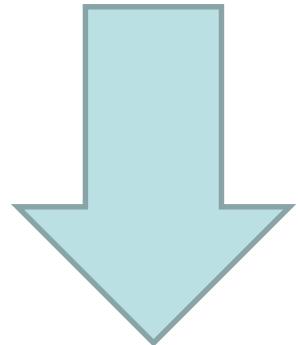

Point of Subjective Equality (PSE)
= What is the value of left weight, which can
be perceived as “same” as the right weight.

Major Methods:

Method of Adjustment, Method of Limit, Method of Constant

● 調整法／Method of Adjustment
被験者が調整する

Easy,
Rough

● 極限法／Method of Limit
実験者が調整する

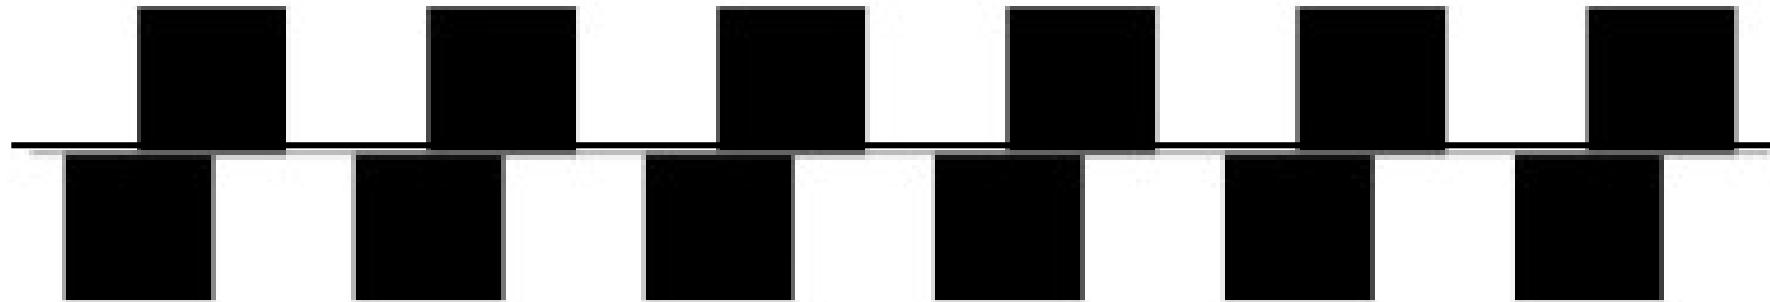

● 恒常法／Method of Constant
調整せず回答の確率分布を見る

Time Consuming,
Precise

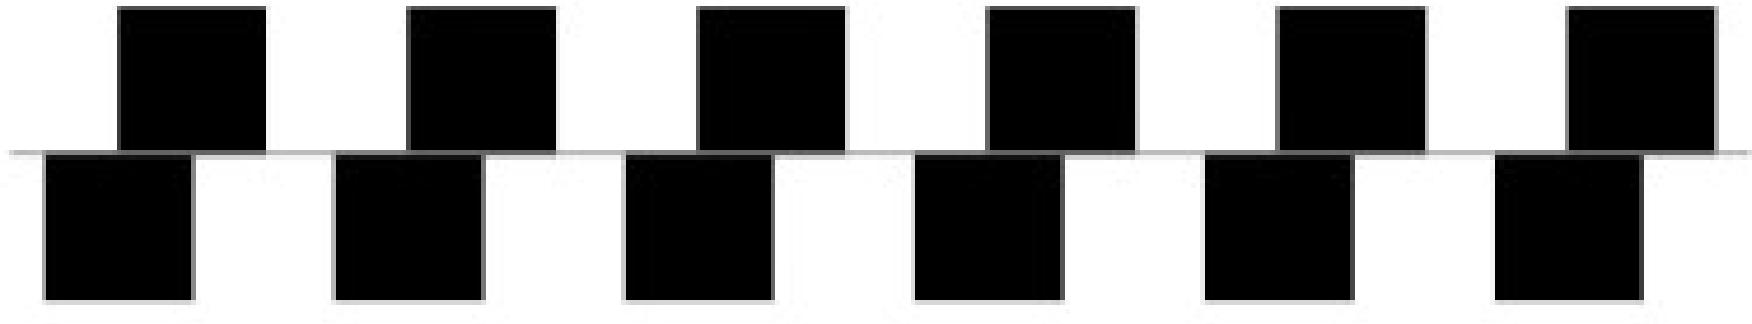

調整法／Method of Adjustment

カフェウォール図形：確かに水平

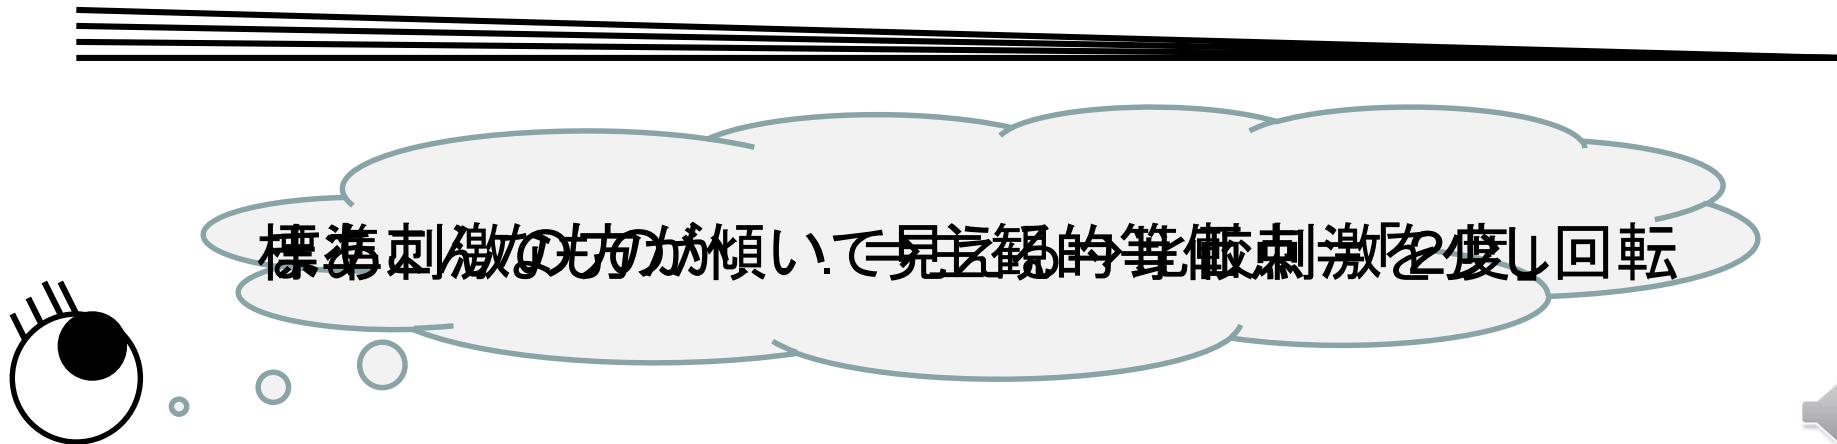

調整法／Method of Adjustment

標準刺激／Standard Stimulus

比較刺激／Comparison Stimulus

極限法／Method of Limit

ミュラー・リヤー錯視
確かに同じ長さです

極限法／Method of Limit

1. 下降系列／Descending Series

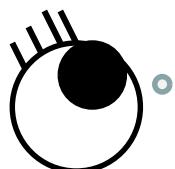

標準刺激
Standard Stimulus

比較刺激
Comparison Stimulus

同じく比較刺激の方が長い→無理や
回答「小」

このときの比較刺激の長さ=上閾値／Upper Threshold

極限法／Method of Limit

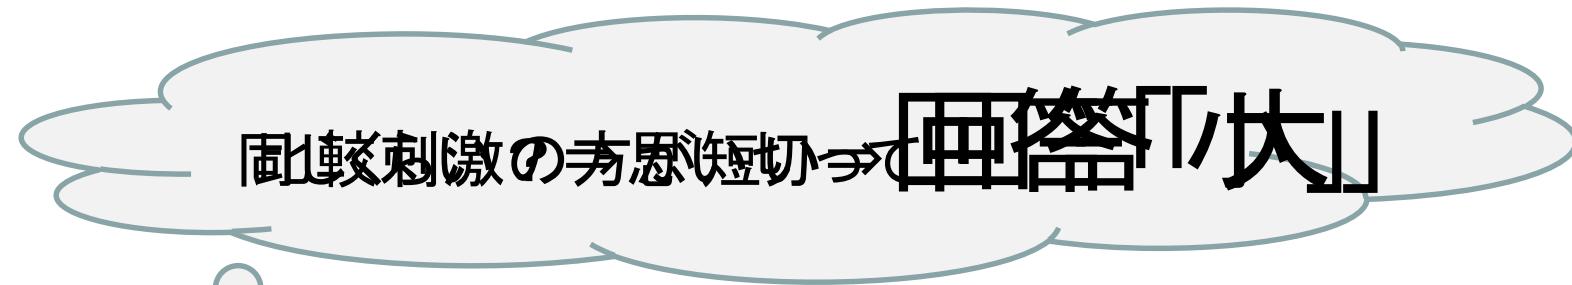

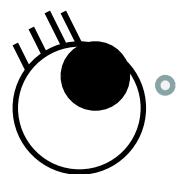

2. 上昇系列／Ascending Series

標準刺激
Standard Stimulus

比較刺激
Comparison Stimulus

このときの比較刺激の長さ = 下閾値 / Lower Threshold

極限法／Method of Limit

閾値の計算

Threshold Calculation

標準刺激:長さ1.0

上閾値:0.95

下閾値:0.85

この結果から、

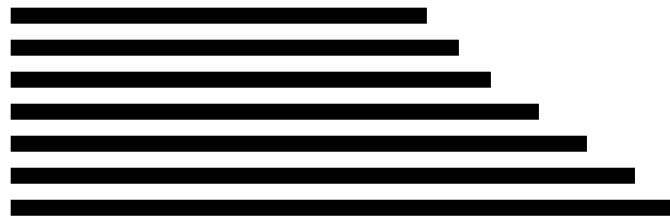

- 主観的等価点(Point of Subjective Equality)は $(0.85+0.95)/2 = 0.90$
- 弁別域(Discrimination Threshold)は $(0.95-0.85)/2 = 0.05$

つまり、この「矢印の錯視」によって、

- 長さが0.9に縮んで見えることと、
- 長さの弁別能力が0.05程度であることが分かった。

恒常法／Method of Constant

標準刺激

Standard Stimulus

比較刺激

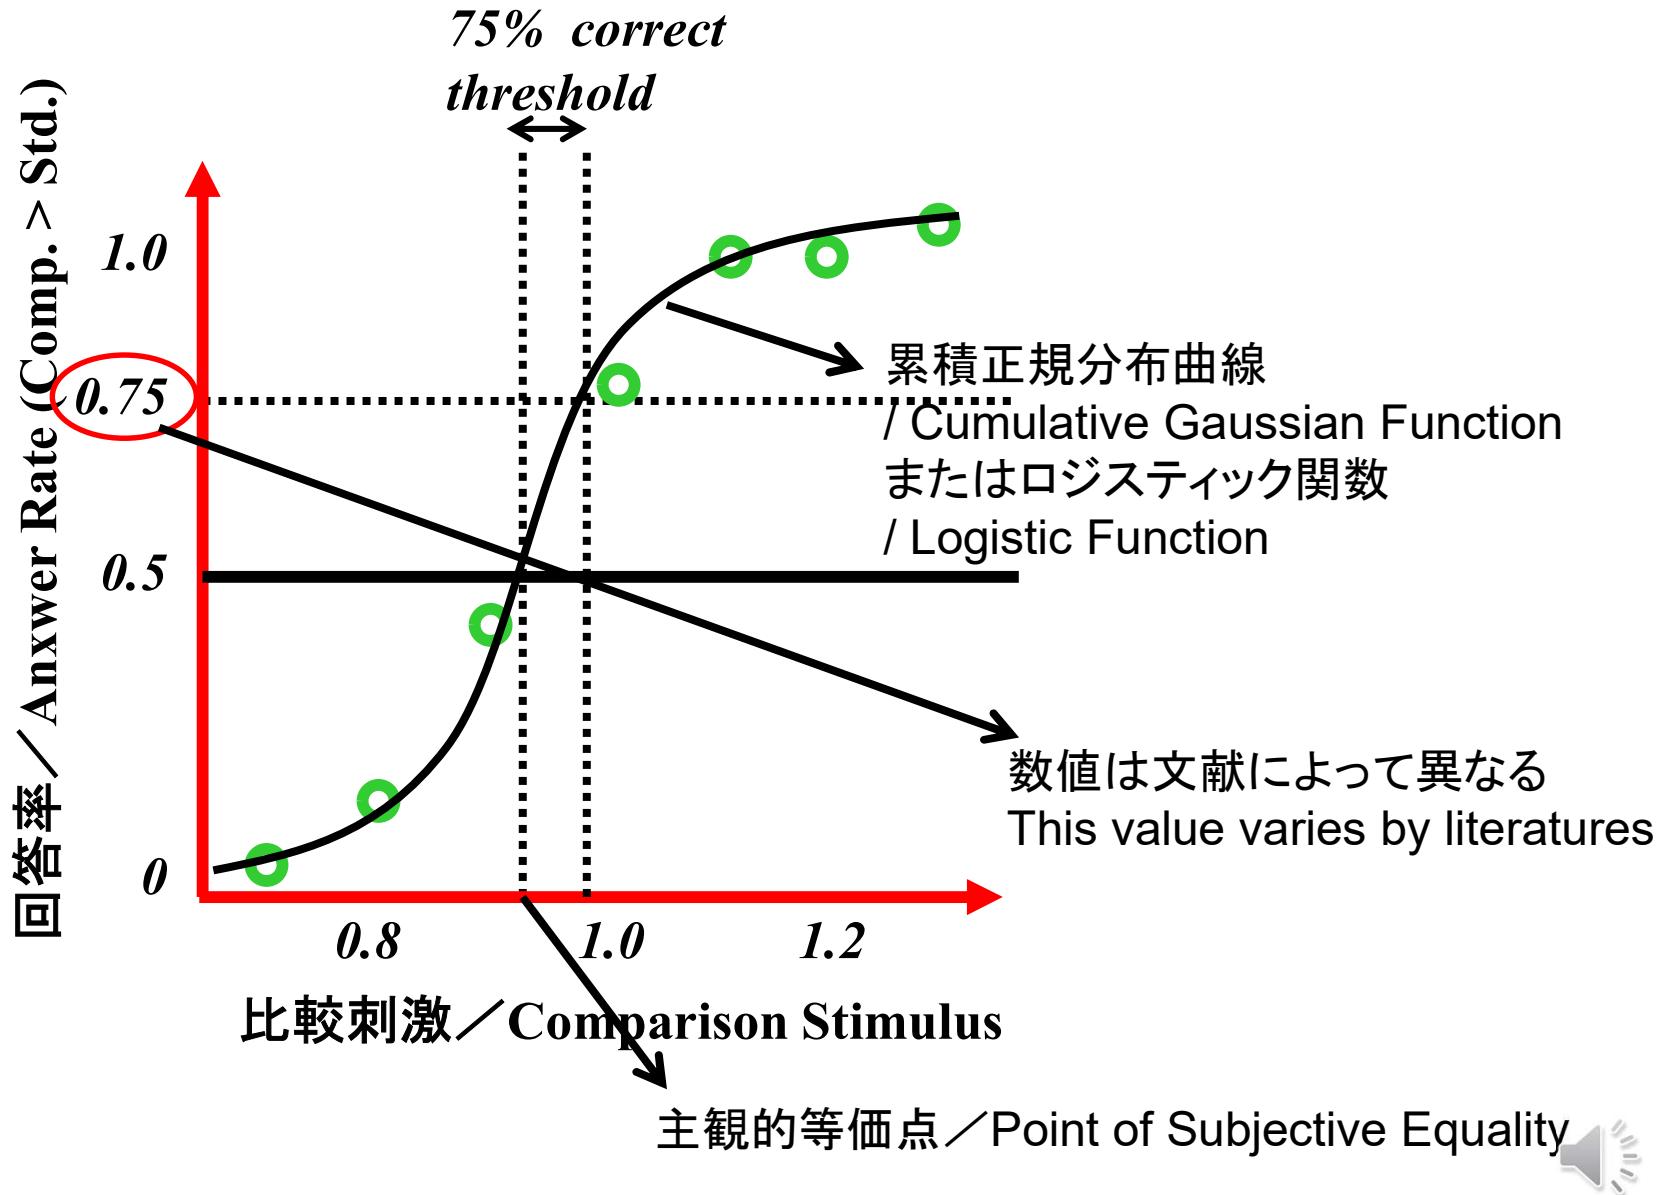

Comparison Stimulus

1. 比較刺激を複数用意する(例では7個)
2. 一個の比較刺激あたりの実験回数を例えば20回とする
3. 合計 $7 \times 20 = 140$ 回、「ランダムに」比較し、強制二択させる

比較刺激	「比較刺激の方が長い」	「比較刺激の方が短い」
0.7	1	19
0.8	3	17
0.9	9	11
1.0	15	5
1.1	17	3
1.2	19	1
1.3	20	0

恒常法／Method of Constant

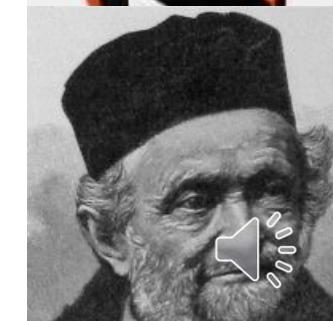

Summary

Measurement of Human perception is necessary for interactive system design.

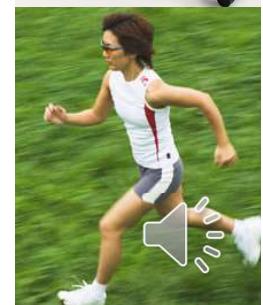

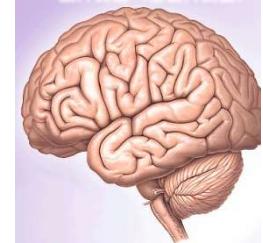

- 脳活動計測／Measure **brain activity**.
- 神経・筋活動計測／Measure **nerve activity**.
- 自律神経系計測／Measure **autonomic nerve related phenomenon**.
- 運動計測／Measure **motion**.
- 心理物理実験／Ask the user (**psychophysics**)

They can be used both as a **evaluation tool**, and **part of an interactive system**

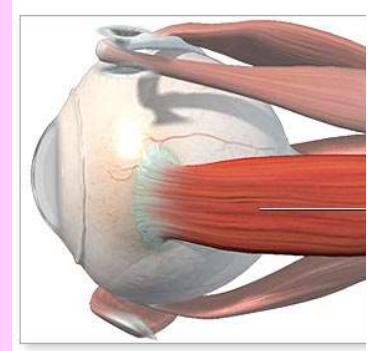

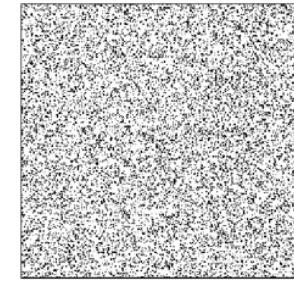

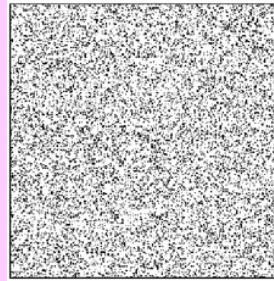

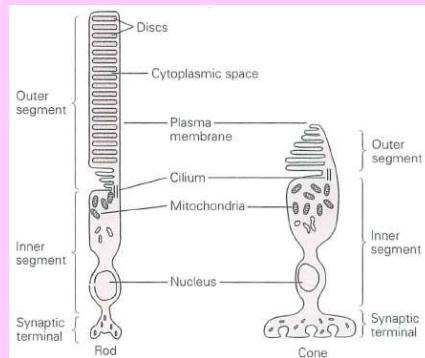

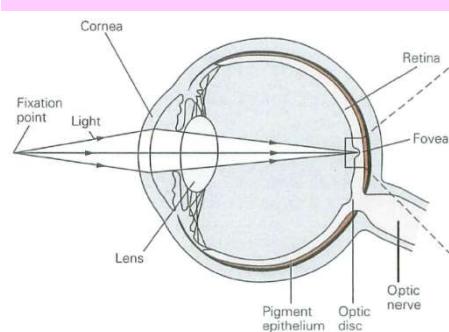

Outline of the lecture

1. 人間計測手法／Measuring Human
2. 視覚／Human Vision System
3. 視覚センシング／Visual Sensing
4. 視覚ディスプレイ／Visual Display
5. 聴覚、聴覚インターフェース／Auditory Interface
6. 触覚、触覚インターフェース／Tactile Interface
7. 力覚、力覚インターフェース／Haptic Interface
8. 移動感覚インターフェース／Locomotion Interface

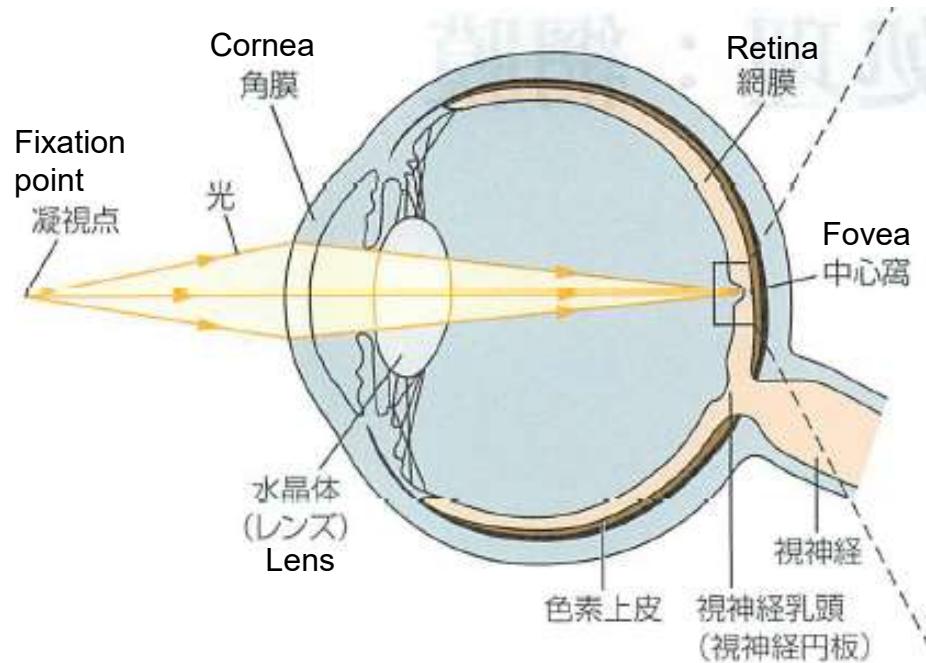

TODAY's TOPIC

- 目の構造／Eye structure
- 目のセンサ／Eye sensors
- 奥行き知覚／Depth perception
- 眼球運動／Eye movement

眼の構造／Eye Structure

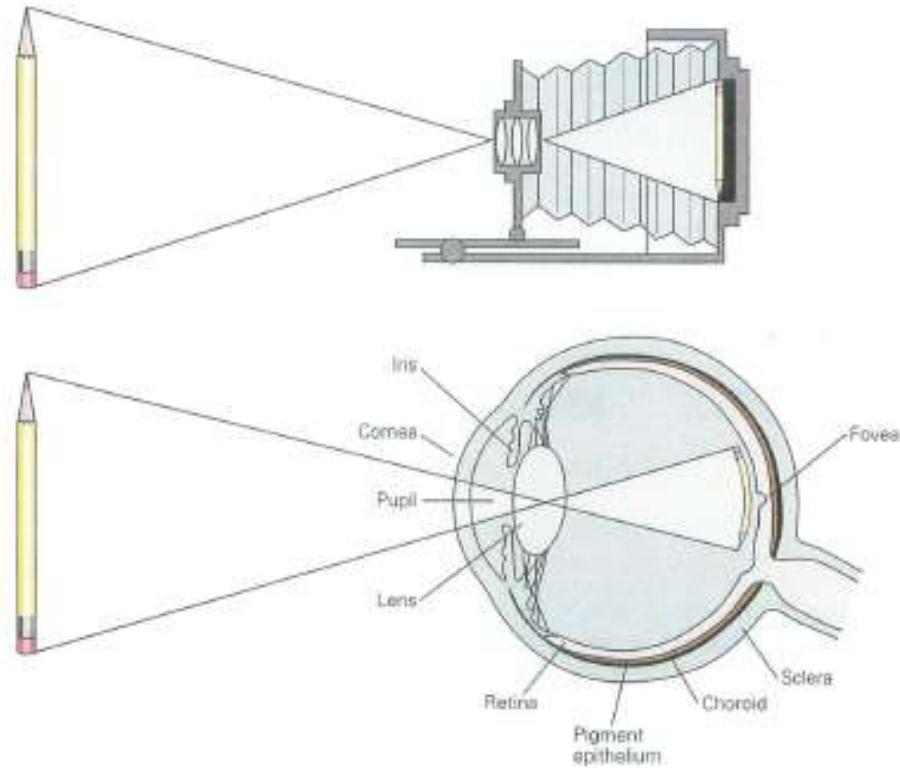

カンドル神経科学(Principles of Neural Science)
<https://www.medsi.co.jp/kandel/syousai/index.html>

- 角膜／Cornea: surface lens
 - LASIK: Laser in Situ Keratomileusis
- 水晶体／Lens: Internal lens.
 - Focal length is adjustable by deformation.
- 虹彩／Iris: Adjust amount of light.
- 網膜／Retina: Light sensor

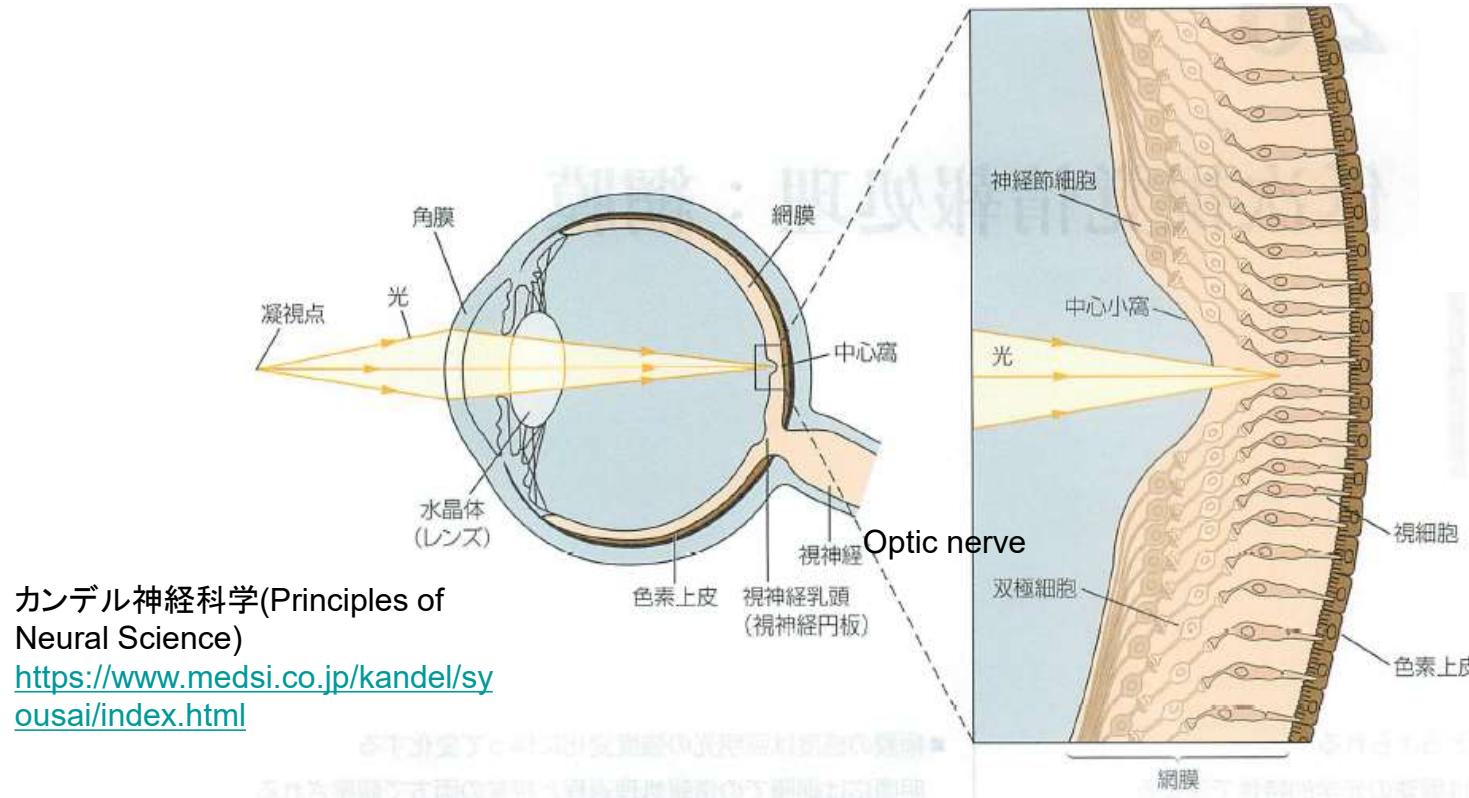

カメラとの比較／Comparison with Camera

- レンズ／Lens
Camera: 1
Eye: 2
- 虹彩／Iris: same
- センサ／Sensor
Camera: Film or CCD
Eye: Retina
- One apparent difference = Focal length adjustment(焦点調節)
 - Camera: Shift lens
 - Eye: Deform lens

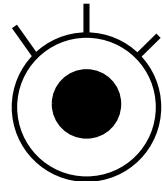

網膜／Retina = Optical Sensor

- 中心窩／Fovea: Center of vision. Very high spatial resolution.
- Optic nerve: Nerve from retina to brain.
Optic nerve is **in front of** the retina. (transparent)
- 盲点／Optic disc (blind spot): Hole that optic nerve axons exit.

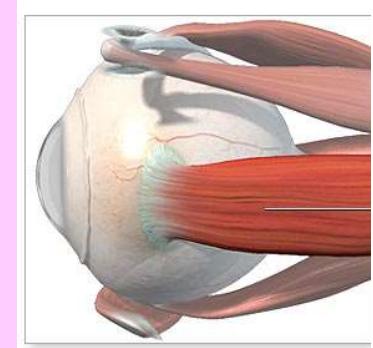

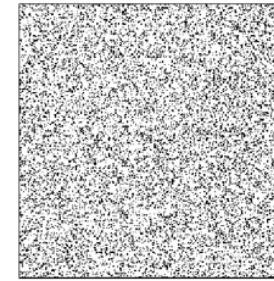

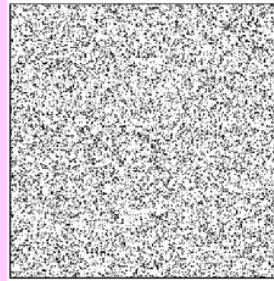

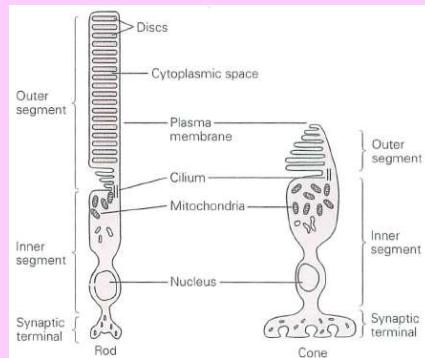

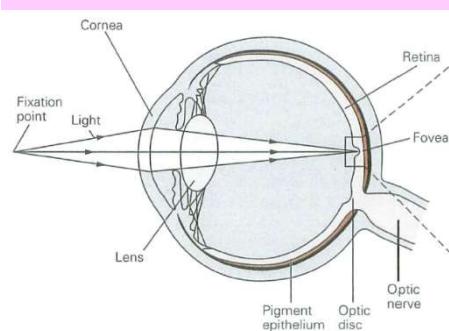

盲点／Blind Spot

- Close your right eye, and gaze ‘+’ with your left eye.
- Move the paper back and forth, and find disappears.
- You also find the fish line connected.

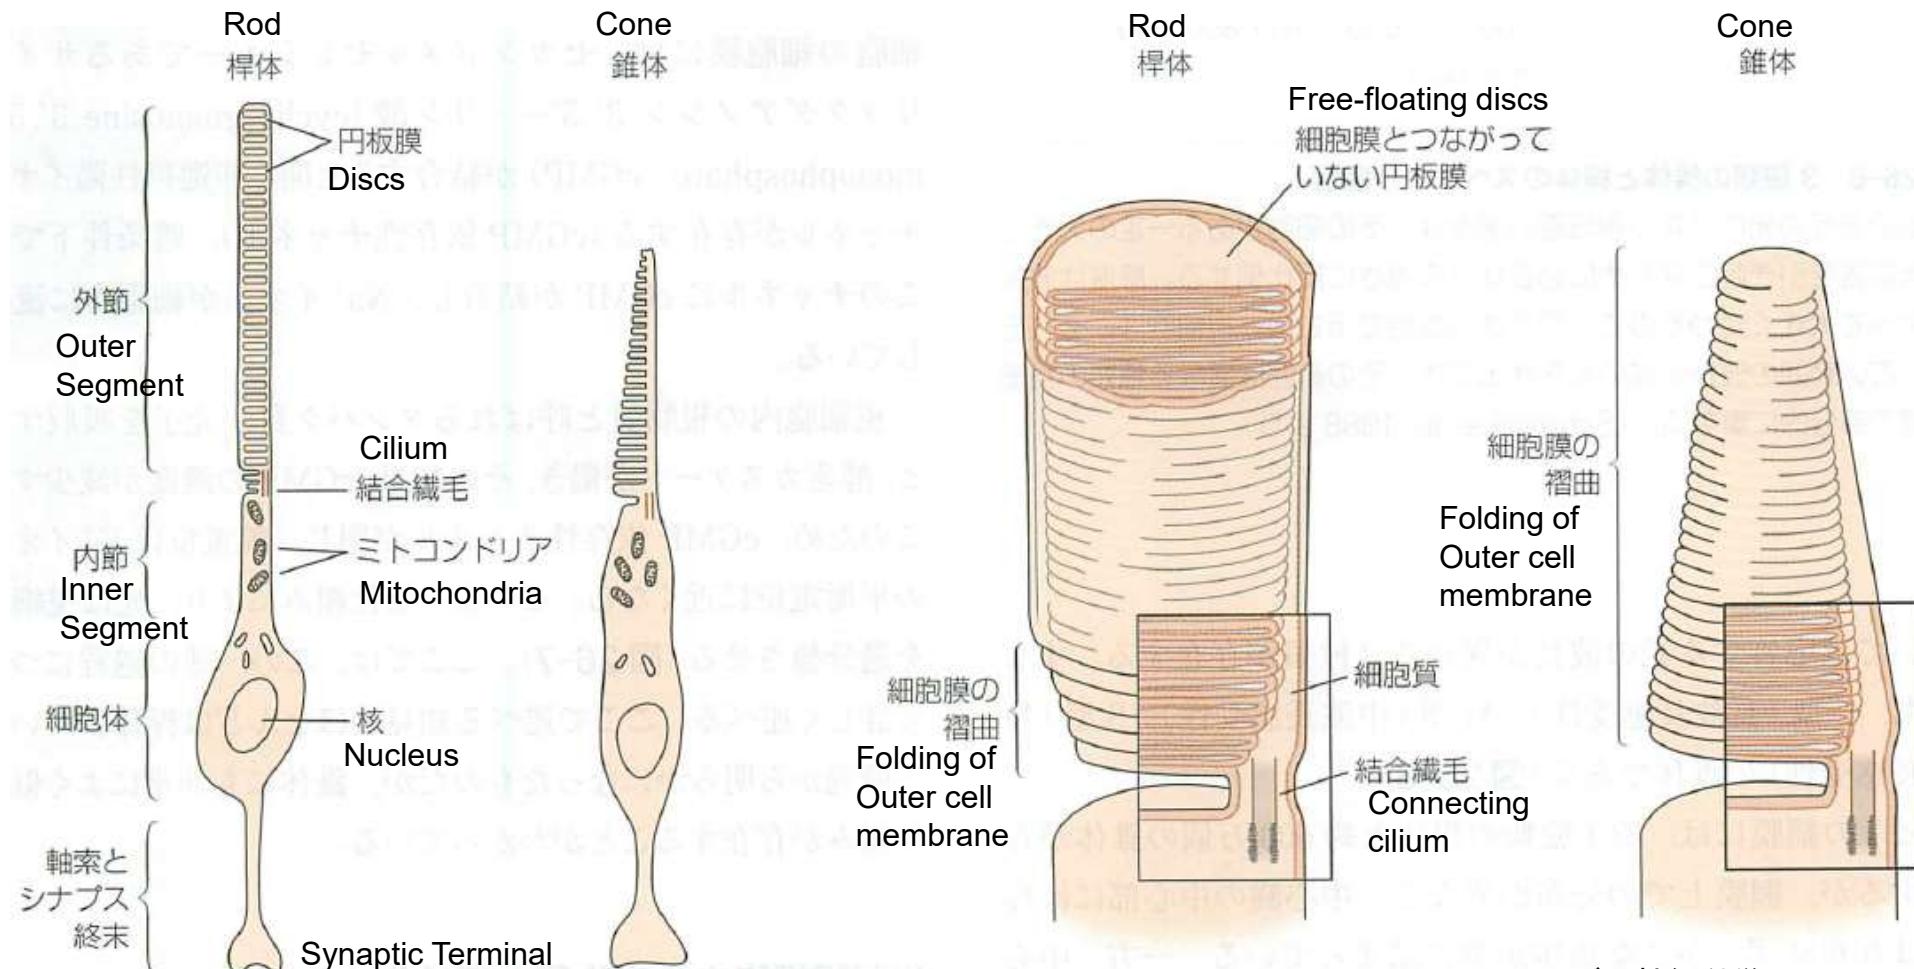

TODAY's TOPIC

- 目の構造／Eye structure
- 目のセンサ／Eye sensors
- 奥行き知覚／Depth perception
- 眼球運動／Eye movement

網膜の視細胞／Optic cells in the retina

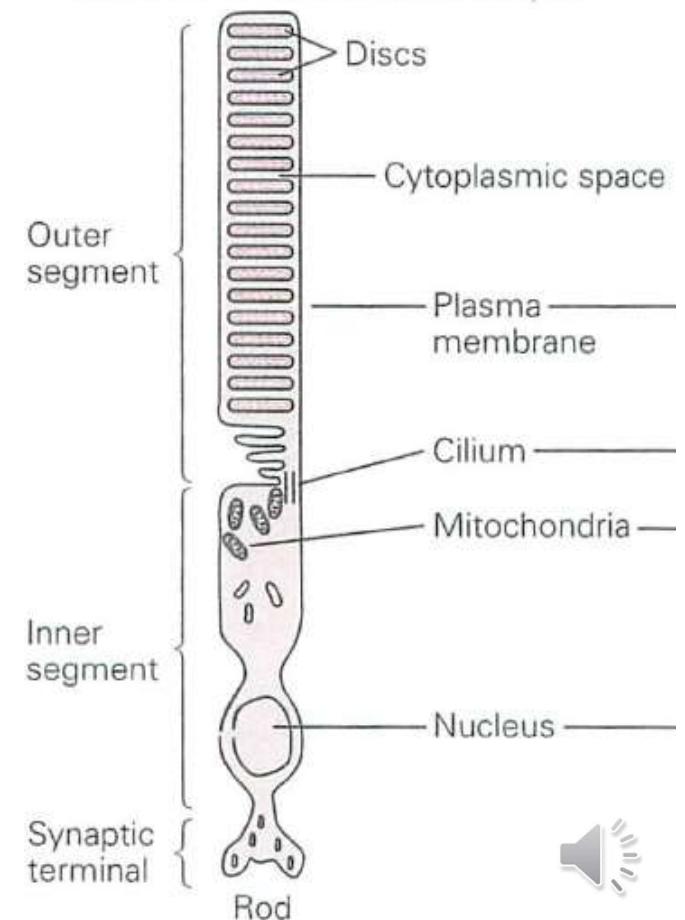

- Rod Cell (桿体細胞) and Cone Cell (錐体細胞)
 - Light to electric conversion is done at outer segment.
 - Channels composed of protein is opened by the light.
 - Rod cell has longer outer segment.

カンデル神経科学(Principles of Neural Science)
<https://www.medsi.co.jp/kandel/syousai/index.html>

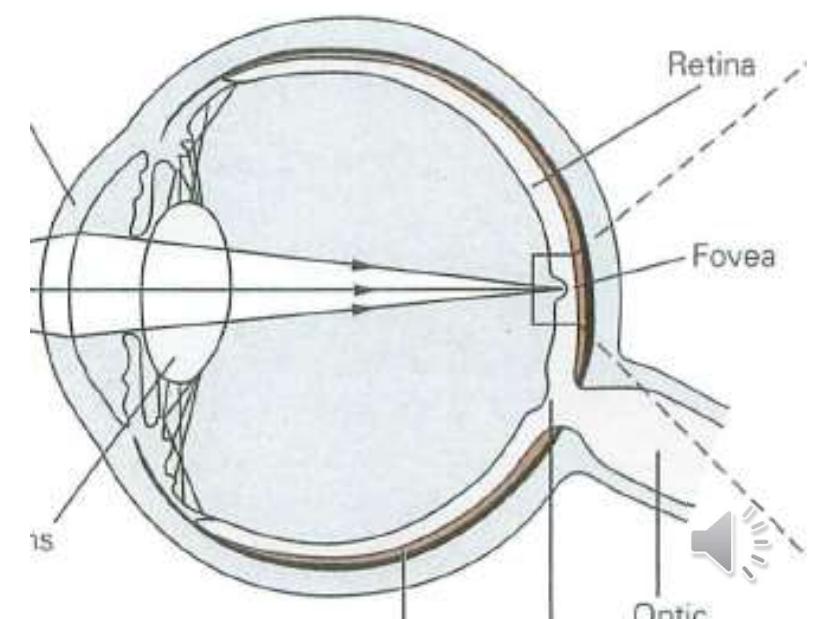

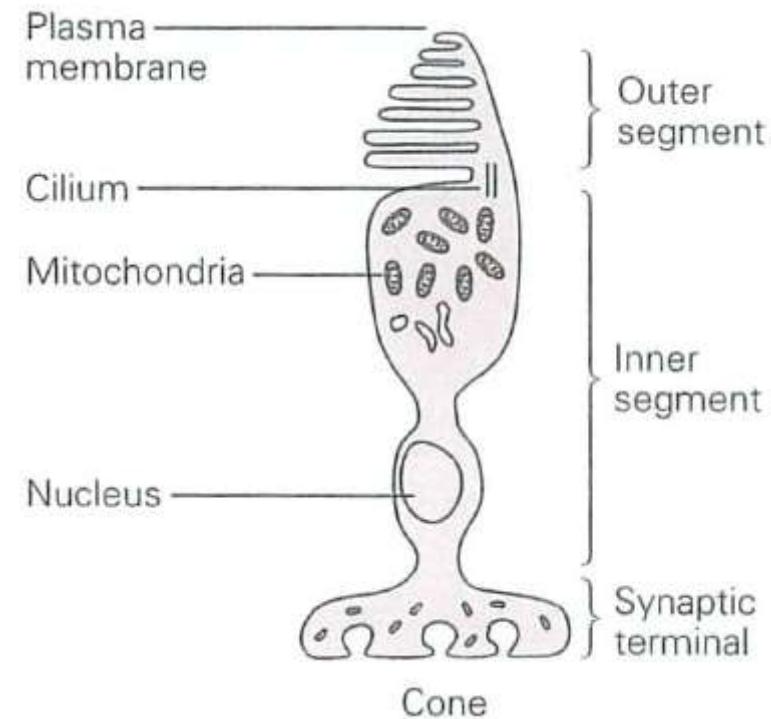

桿體細胞／Rod cell

- Black and White sensor.
- Plays major role when dark
- High sensitivity (x100 cone cell)
 - Can capture single photon
- One eye has 130,000,000 cells.
- Slow response.

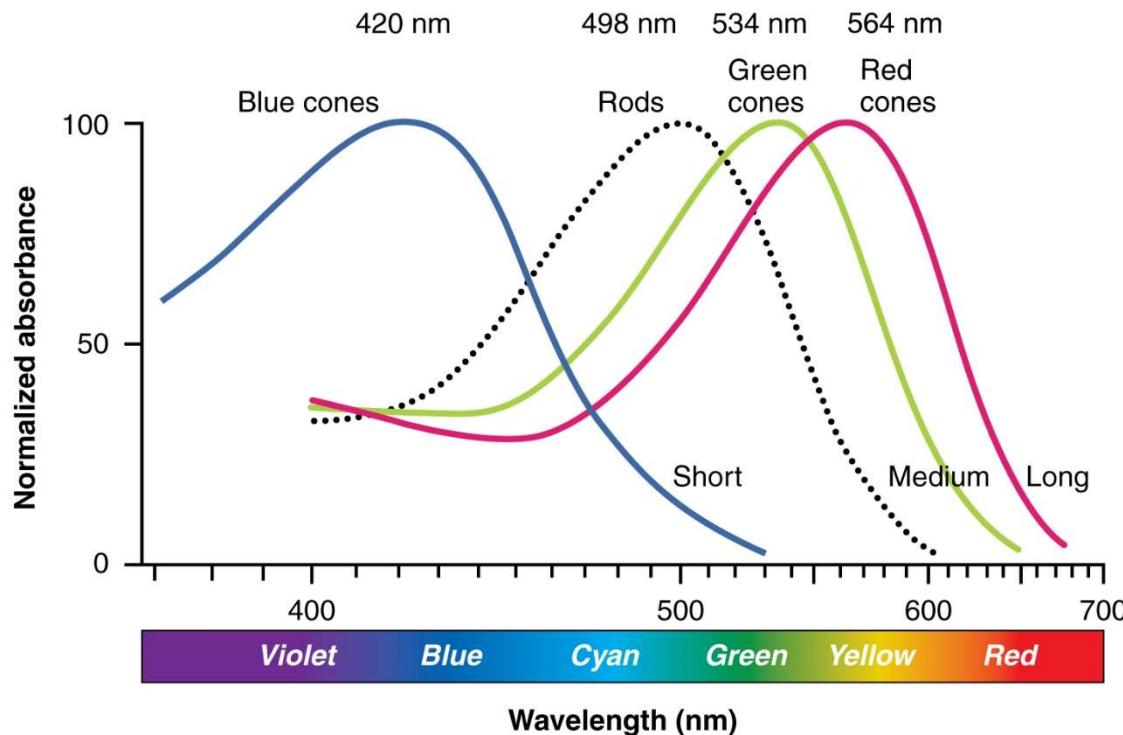

錐體細胞／Cone cell

- Color sensing
 - Three types (L,M,S)
 - Caused by different proteins in the channel.
- Play major role when bright.
- Has lower sensitivity.
- One eye has 7,000,000.
- Clustered at fovea (中心窩).
- Fast Response.

桿體細胞・錐體細胞／Rod cell & Cone cell

Photoreceptor Cells (Wikipedia)
https://en.wikipedia.org/wiki/Photoreceptor_cell

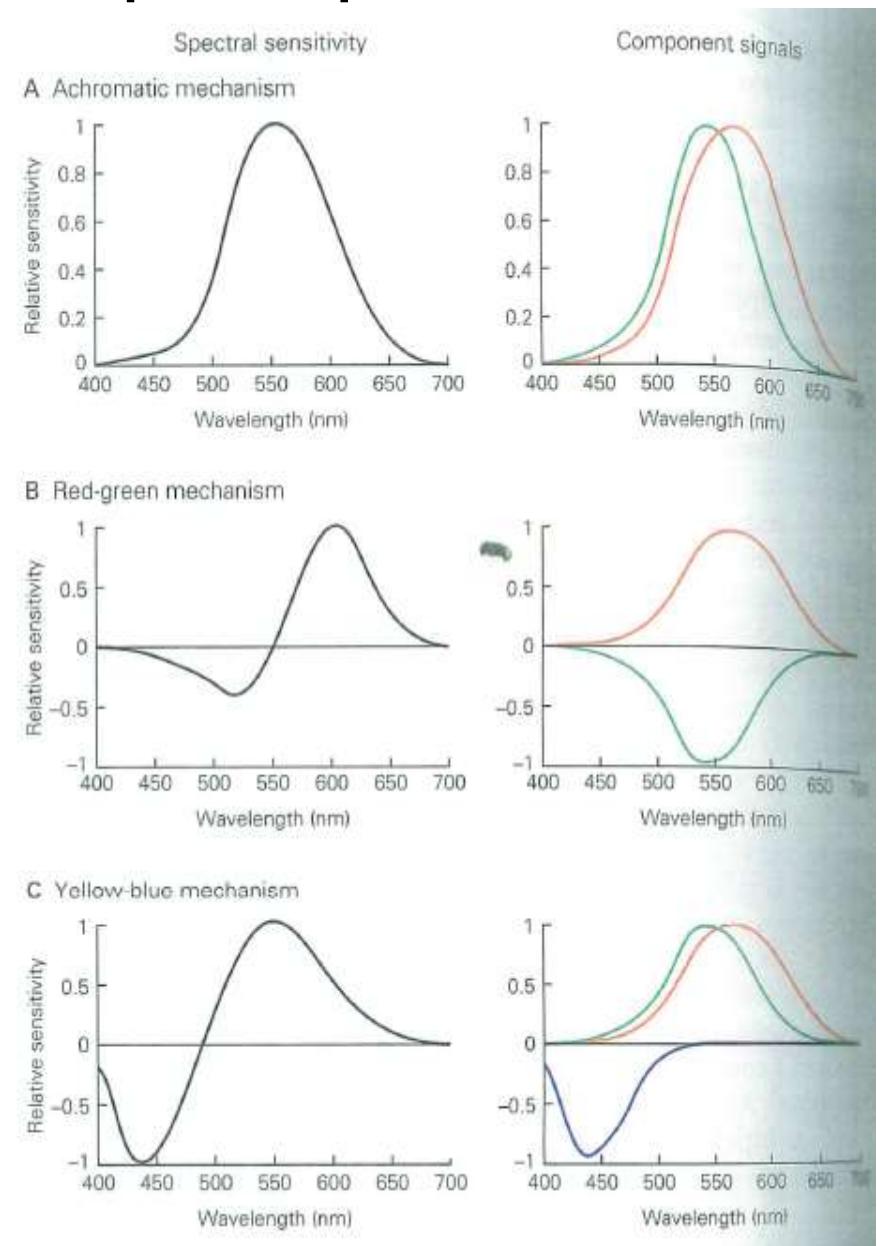

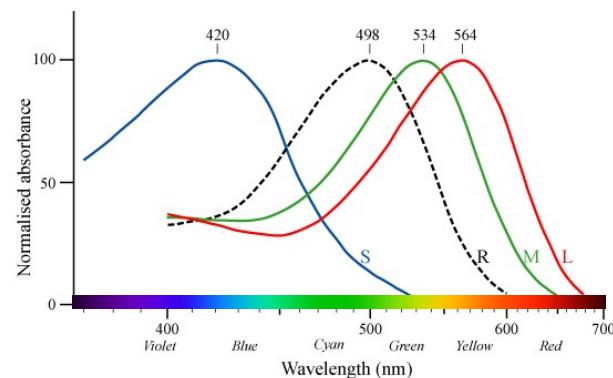

- Rod cell: black & white sensor.
 - peak = 498nm.
 - Green Laser Pointer is the best for presentation.
- Cone cell: Three types
 - S: 420nm, M: 534nm, L: 564nm
 - Color perception is based on the combination of the three.

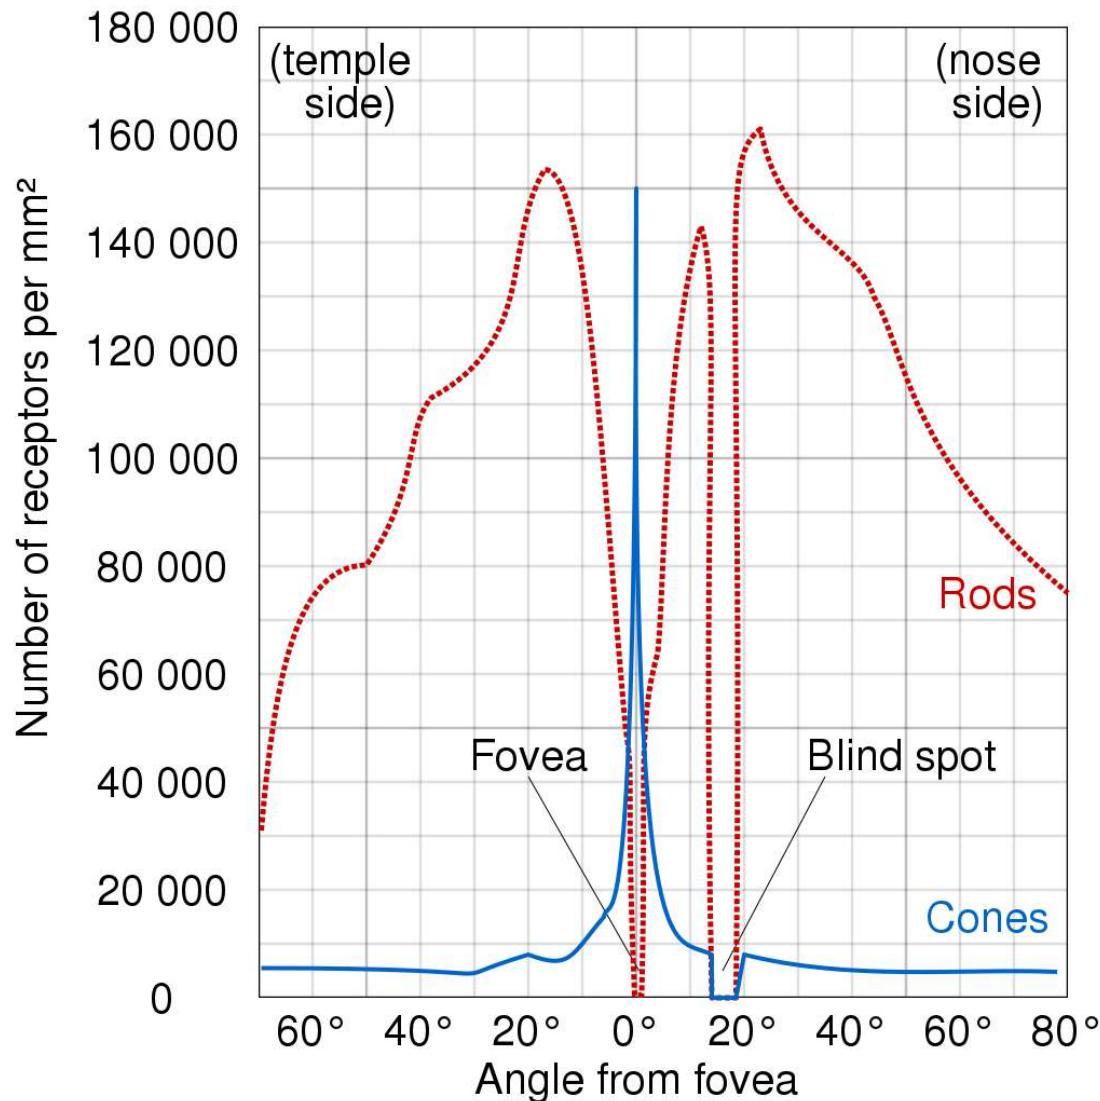

色知覚メカニズム／Brain color perception \neq R,G,B

Take **differentials** and
compose another 3 axis.

- $L+M(+S)$ (Brightness)
- $M-L$ (Red-Green axis)
- $S-(L+M)$ (Blue-Yellow axis)
- They are the basis of
“complementary color”(補色)
 - there is no such thing as “reddish green”

桿体・錐体の分布／Distribution of the cells.

Photoreceptor Cells (Wikipedia)
https://en.wikipedia.org/wiki/Photoreceptor_cell

- Cone cell = central vision
(中心視)
 - ✓ Peripheral vision is almost color blind
- Rod cell = peripheral vision
(周辺視)
 - ✓ You can see stars better by peripheral vision

周辺視野への情報呈示(1)/Peripheral Display

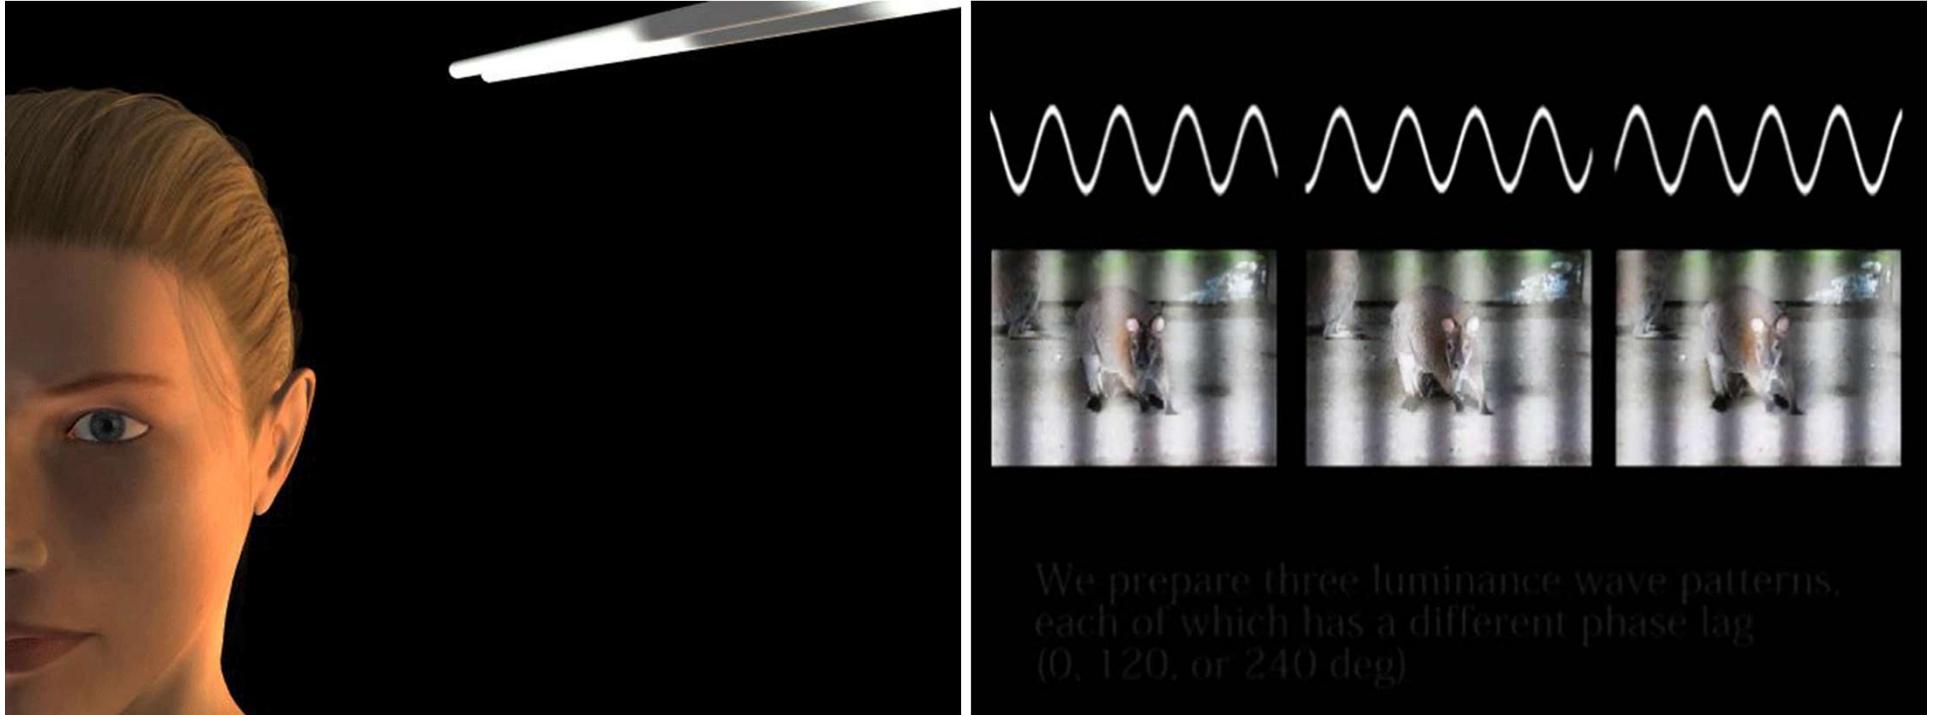

<https://www.youtube.com/watch?v=QLB0RkmKbSQ>

T. Nojima, Y. Saiga, Y. Okano, Y. Hashimoto, H. Kajimoto, "The Peripheral Display for Augmented Reality of Self-Motion", ICAT2007.

- 周辺視野への表示は臨場感を表示するために不可欠
- 周辺視野は空間解像度は低い。
- 周辺視野のほうが時間的解像度(CFF:Critical Fricker Frequency)は高い
⇒LEDマトリクスで運動表示
- 右の動画のように下につけて地面の流れを出すのがポイント
(関連知見:深澤「ウェクションにおける地面優位効果」H18年度東京大学卒業論文)

周辺視野への情報表示(2)/Peripheral Display

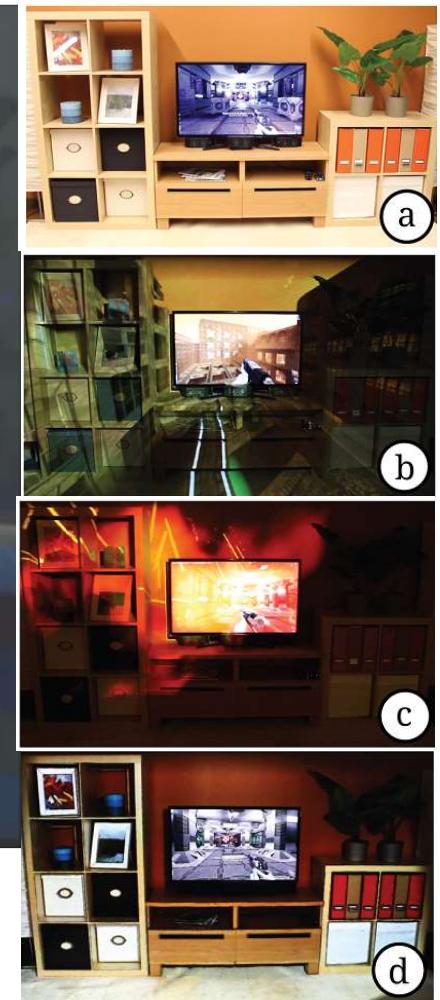

Y. Okano, S. Fukushima, M. Furukawa, H. Kajimoto, "Embedded Motion", SIGGRAPH Asia 2010, Poster, Korea.

- 周辺視野のほうが時間的解像度(CFF:Critical Fricker Frequency)は高いことを利用すると、周辺視野にだけ知覚可能な「チラツキ」を運動情報提示として利用できる。
- 見たところがつねに中心視野になるので、視線検出も不要。

周辺視野への情報表示(3)

RGB and YCbCr(YUV, Lab)

RGB: corresponds to 3 cone cells.

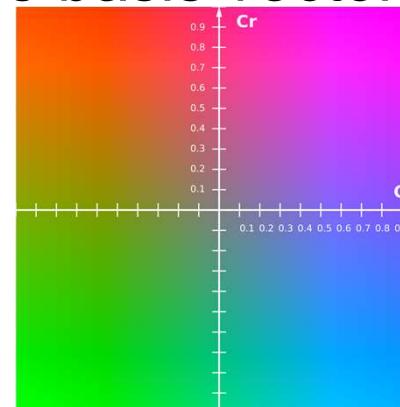

Mathematics tells us...

ANY 3 independent vectors can be basis vectors

YCbCr (YUV):

- Y(brightness)
- Cb(color axis 1)
- Cr(color axis 2)

Similar to brain's color perception

$$Y = 0.257R + 0.504G + 0.098B + 16$$

$$Cb = -0.148R - 0.291G + 0.439B + 128$$

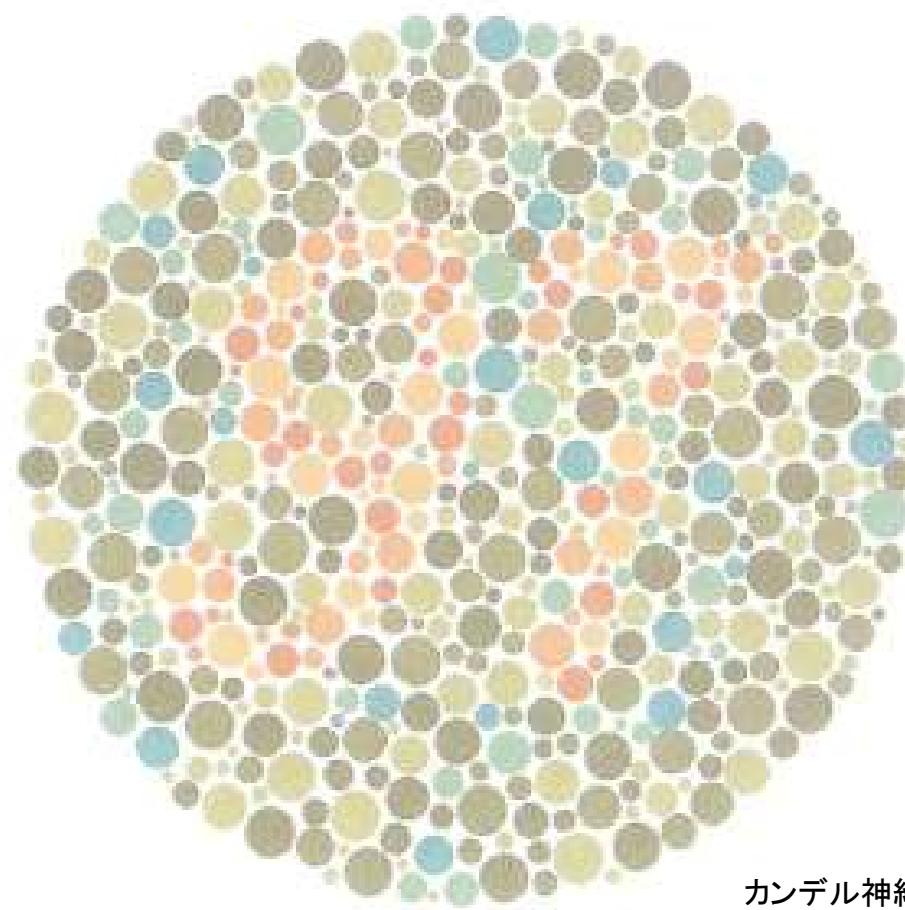

$$Cr = 0.439R - 0.368G - 0.071B + 128$$

Used in image compression

YCrCb (Wikipedia)
<https://en.wikipedia.org/wiki/YCbCr>

色覚のバリエーション／Color blindness

カンデル神経科学(Principles of Neural Science)
<https://www.medsi.co.jp/kandel/syousai/index.html>

- One to three types of cone cells lacks.

色覚のバリエーション／Variety of color sense

「色のふしぎ」と

ChromaGlasses: Computational Glasses for Compensating Colour Blindness

Tobias Langlotz, Jonathan Sutton, Stefanie Zollmann, Yuta Itoh, Holger Regenbrecht

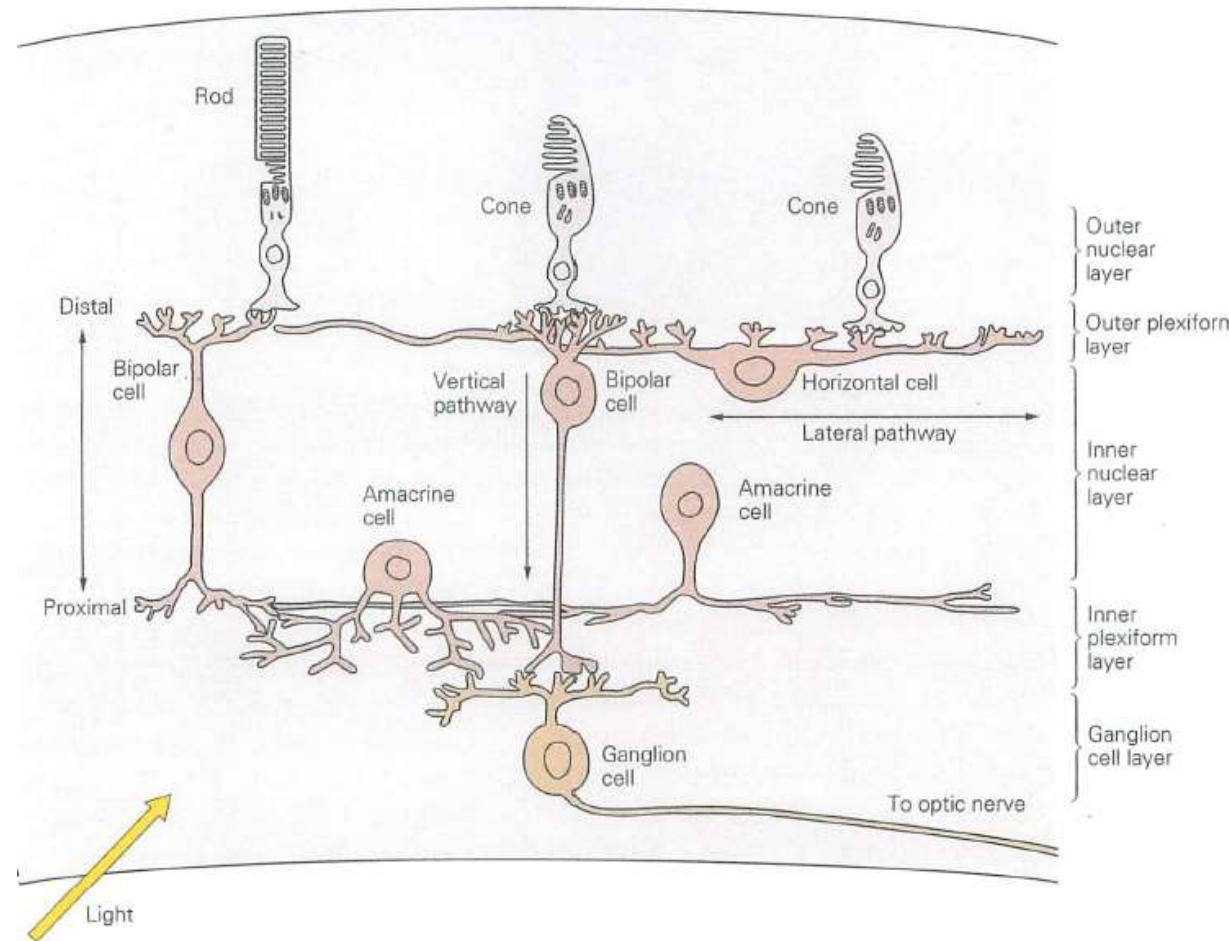

Accepted for ACM CHI 2018

- https://www.youtube.com/watch?v=xx4bPIBtqv0&feature=emb_logo
- 色を区別できるようにするARシステム。

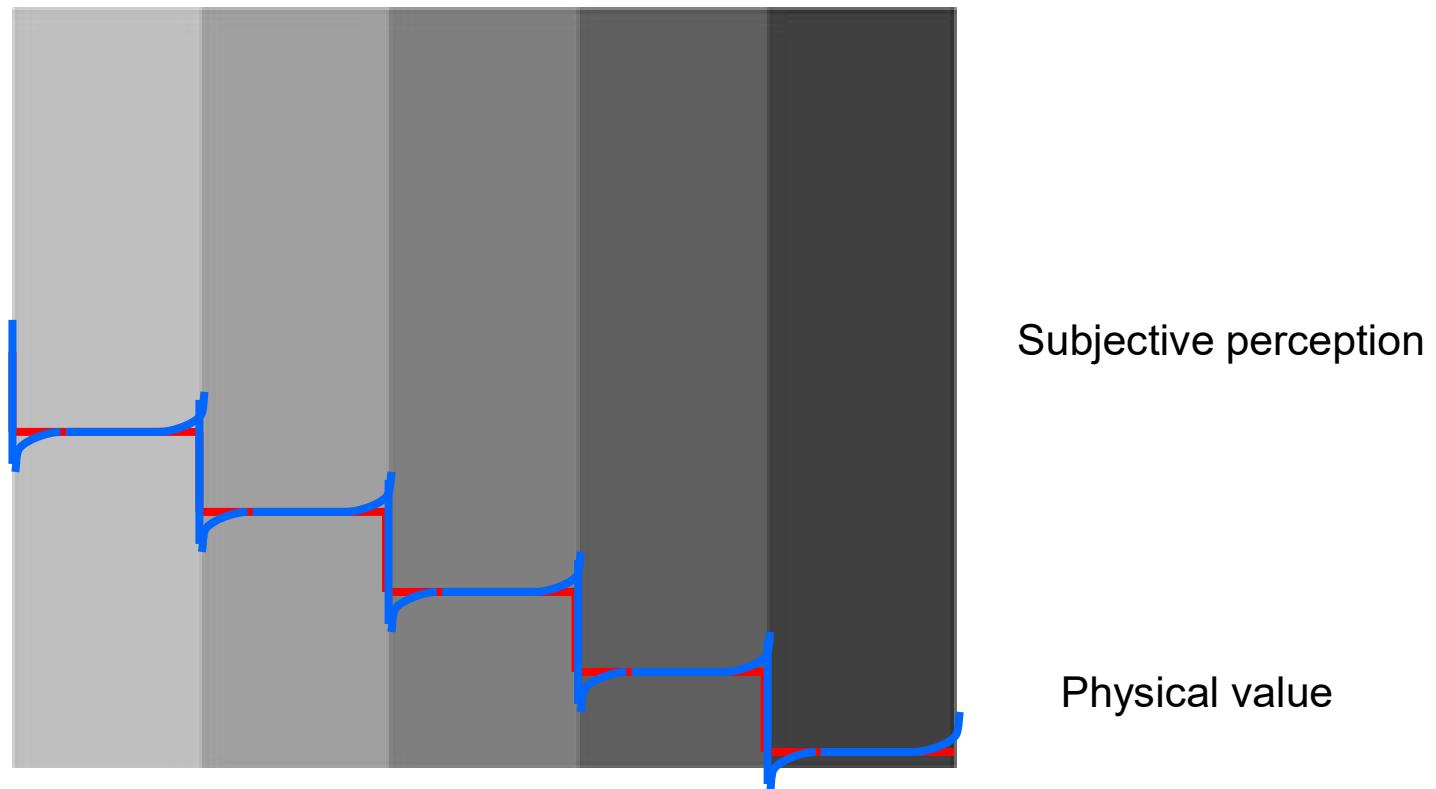

網膜での情報処理／Retinal image processing

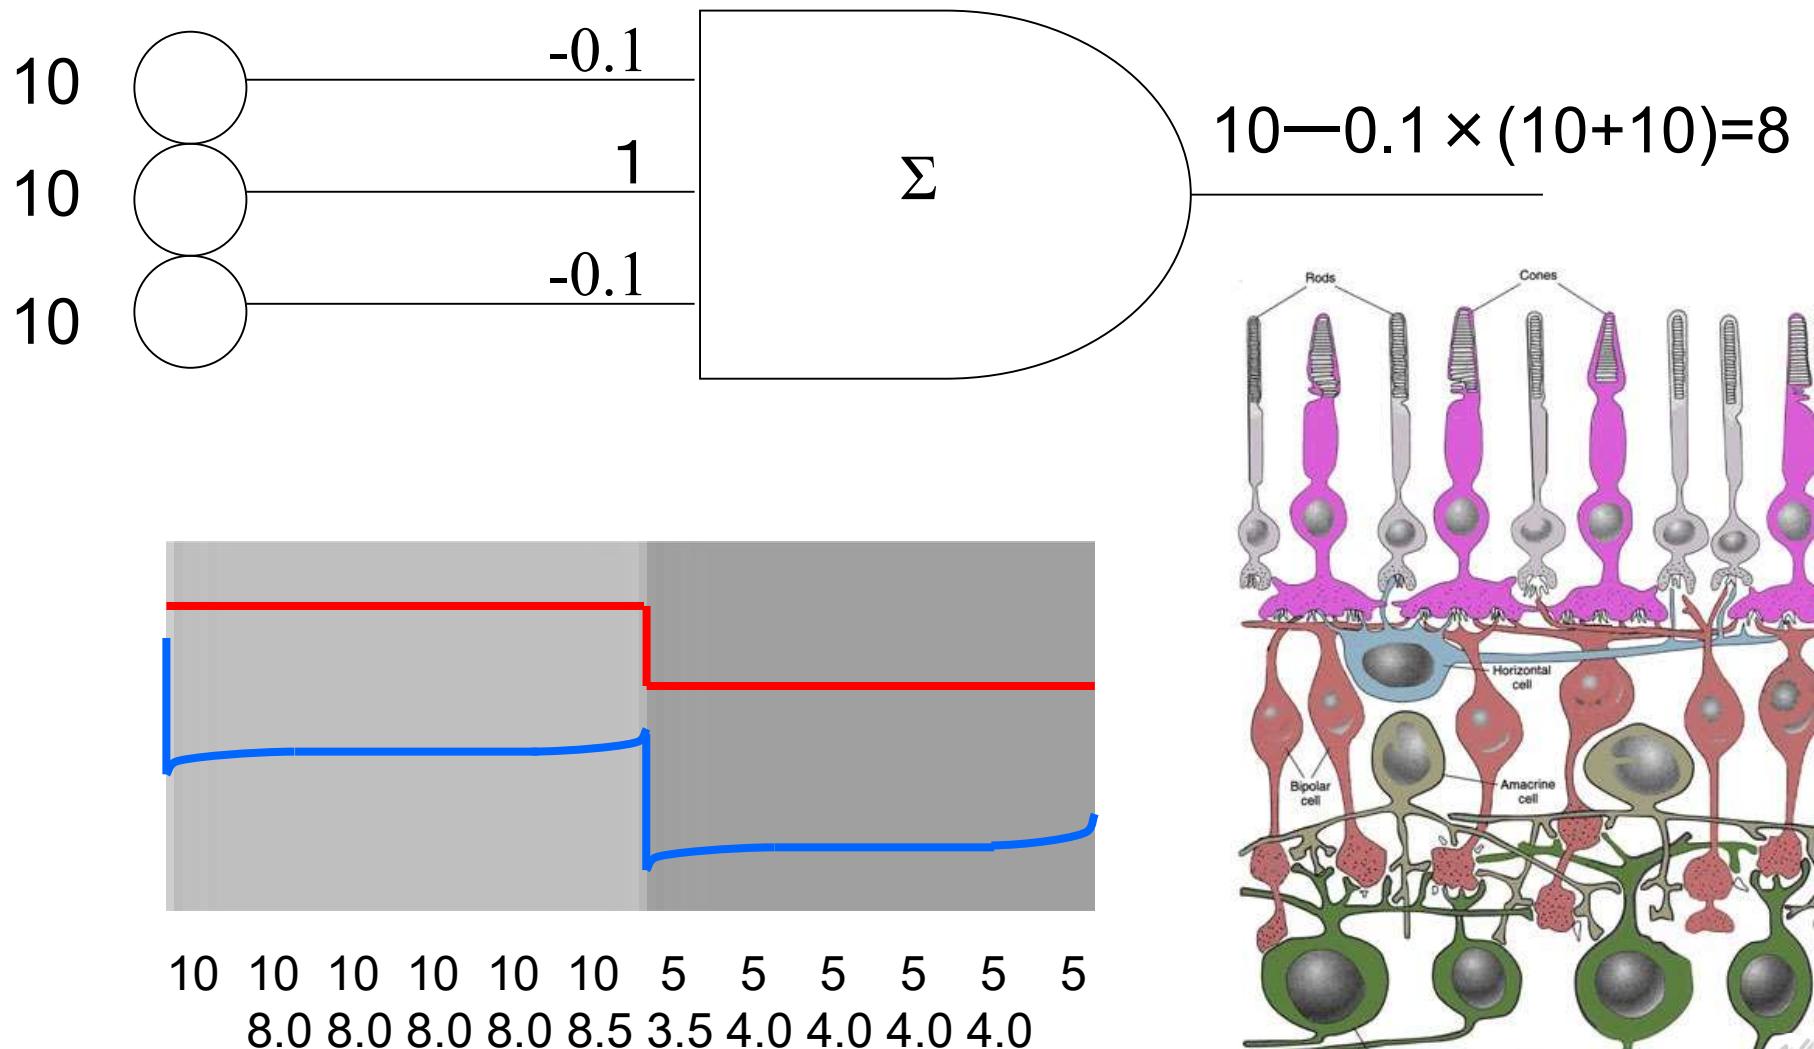

- Sensors: About 200,000,000 / eye
- Nerve axons to the brain: about 1,000,000 / eye
- Retinal image process: 200 cells \Rightarrow 1 output

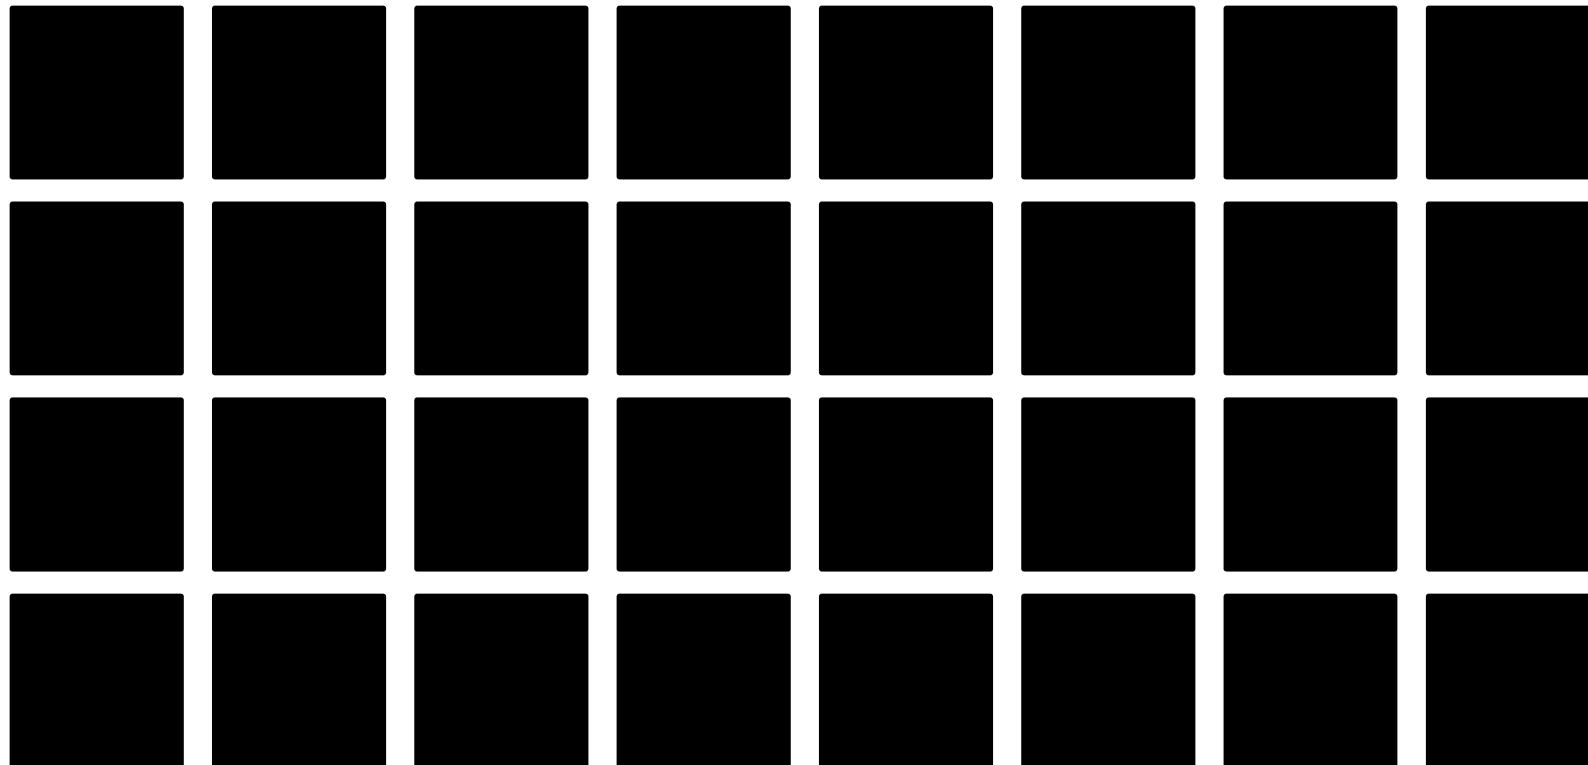

Key to the retinal process: “Mach belt” illusion

側抑制／Lateral inhibition

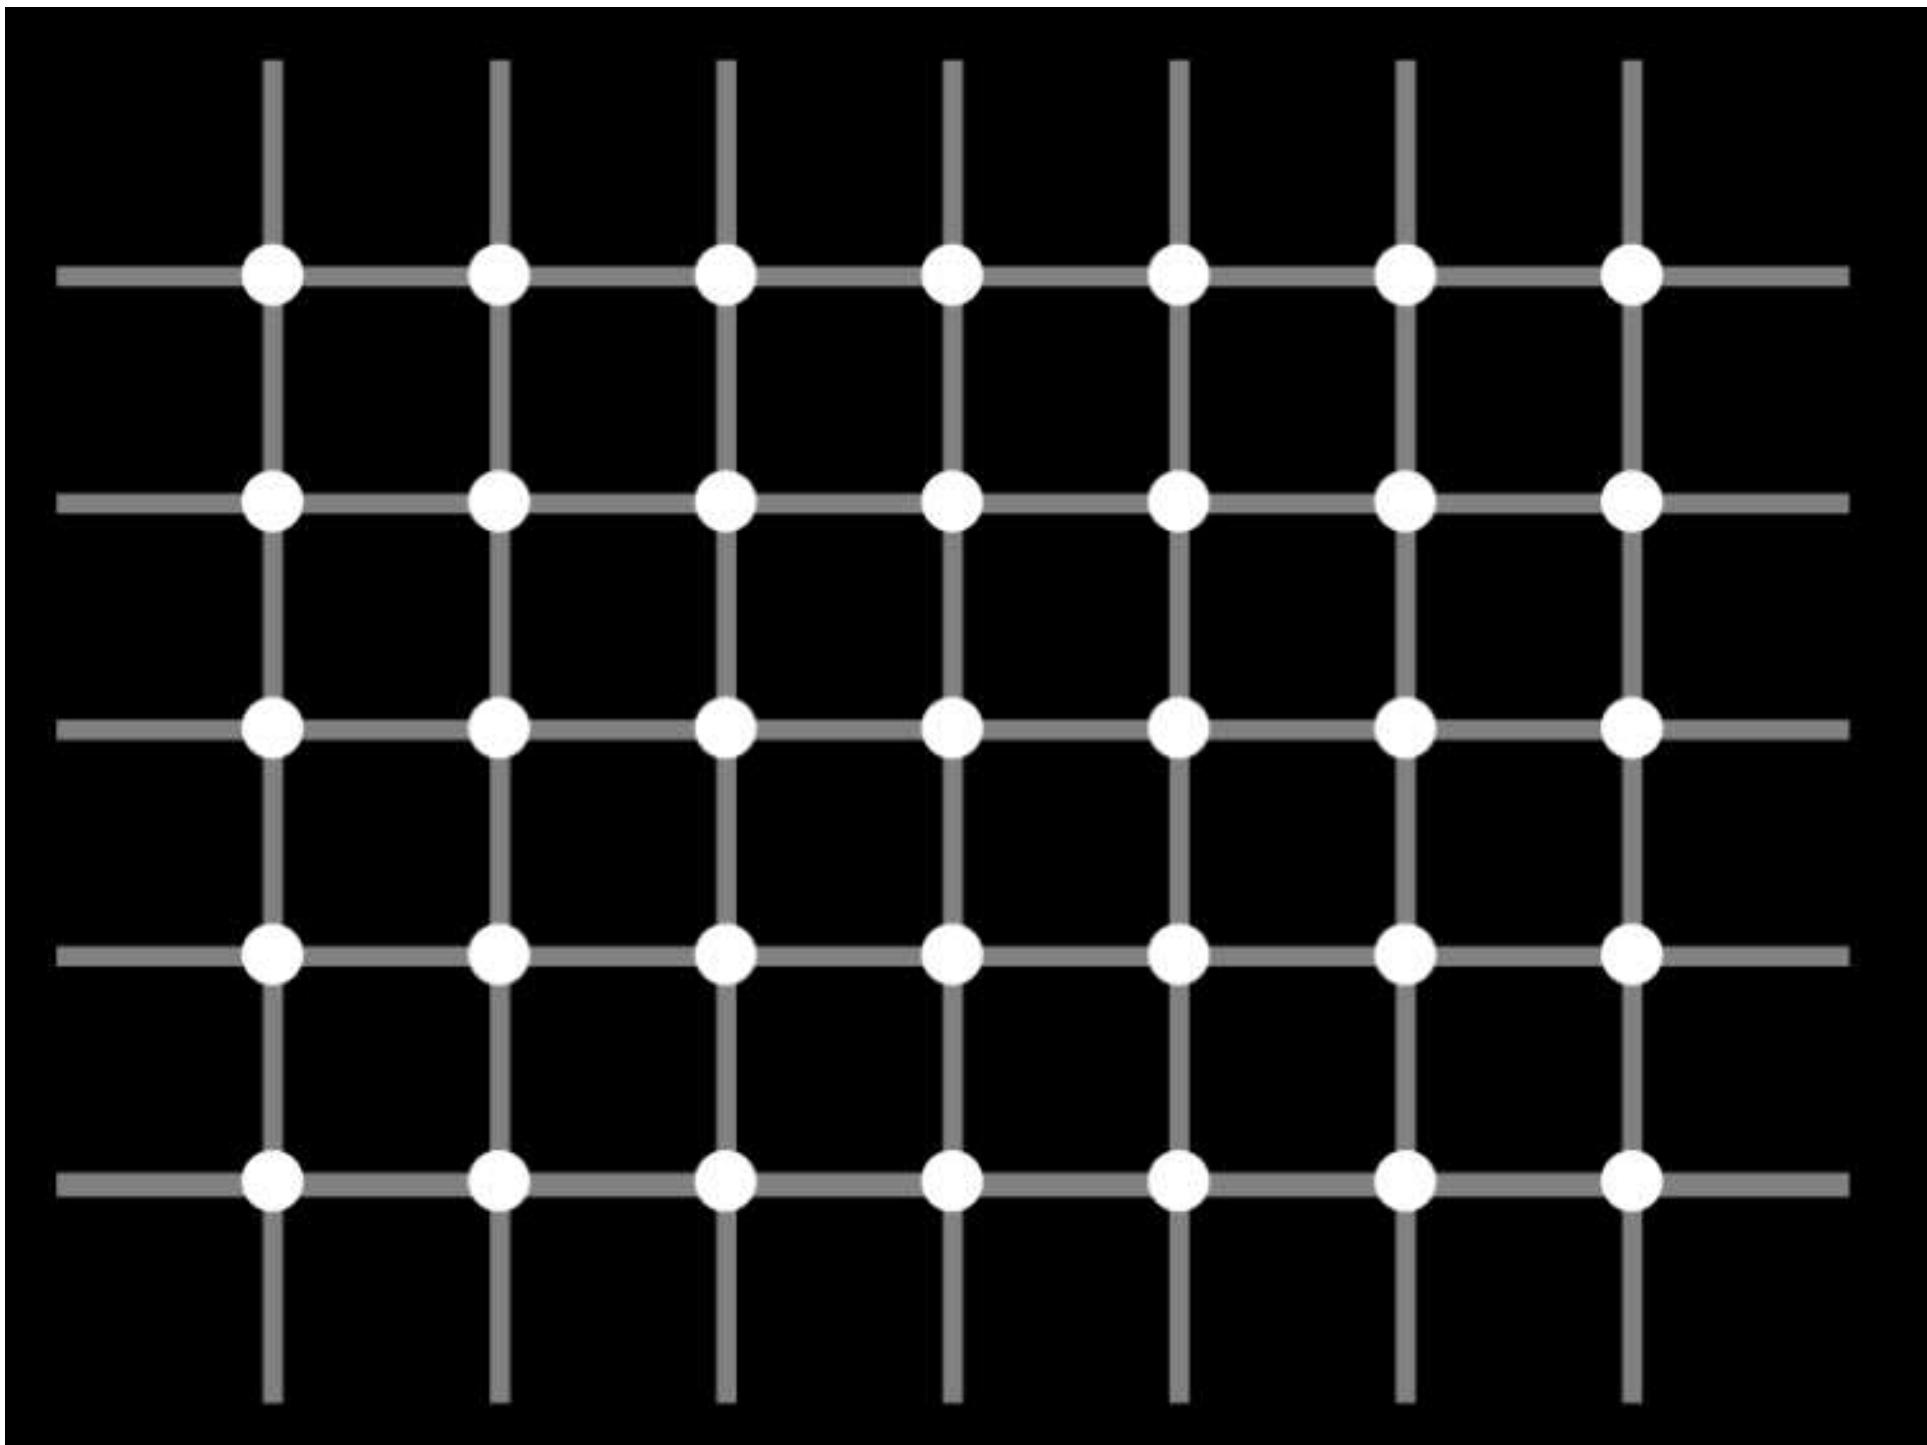

Harman grid illusion

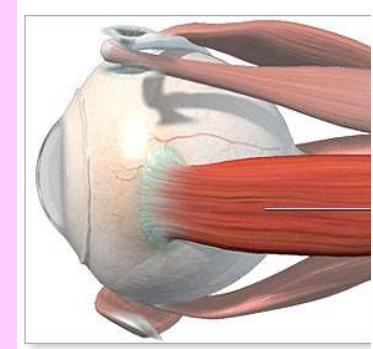

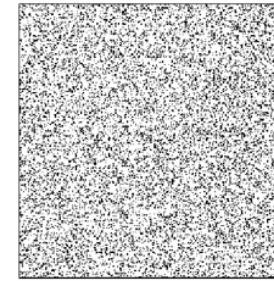

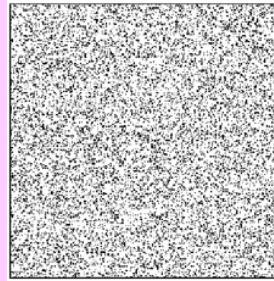

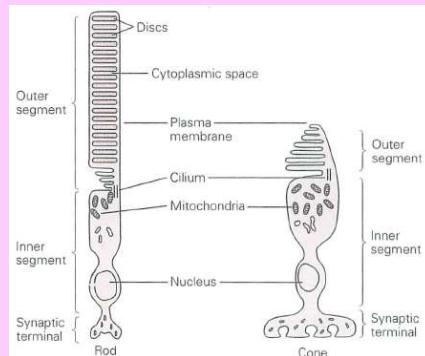

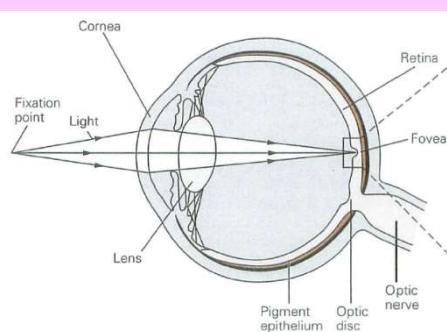

「交差点の周りのほうが、路の周りよりも平均的な明るさが大きい」ために、交差点が暗く感じられる」と説明される。

- (1) 周辺視／peripheral vision: the cross point becomes dark, due to lateral inhibition
 - (2) 中心視／central vision: No such effect
- ⇒The peripheral vision “compress” larger field.

TODAY's TOPIC

- 目の構造／Eye structure
- 目のセンサ／Eye sensors
- 奥行き知覚／Depth perception
- 眼球運動／Eye movement

奥行き知覚の鍵／Depth perception cues

- 単眼性／With single eye
 - 経験／Experience
 - 焦点調節／Accommodation
 - 運動視差／Motion Parallax

- 両眼性／With two eyes
 - 輻輳角／Vergence eye movement
 - 両眼視差／Binocular disparity

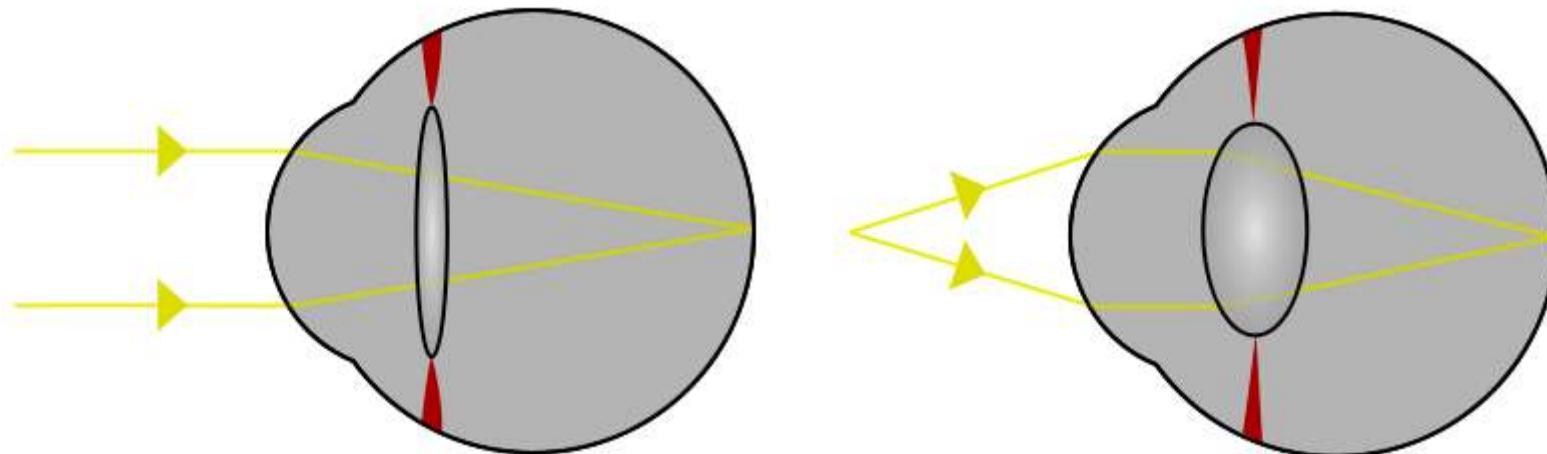

Depth cue(1) 経験／Experience

- 記憶／Memory
Knows the physical size
- 遠近法／Perspective
Near= Large, Bottom, Clear
Far = Small, Top, Blur
- 重なり(遮蔽)／Occlusion
Occluded (shielded) objects are more distant than occluding (shielding) objects

Depth cue(2) 焦点調節／Accommodation: Changing the power of the lens

- Automatic focus adjustment by lens deformation
- The adjustment itself works as a depth cue.
 - works at close range.

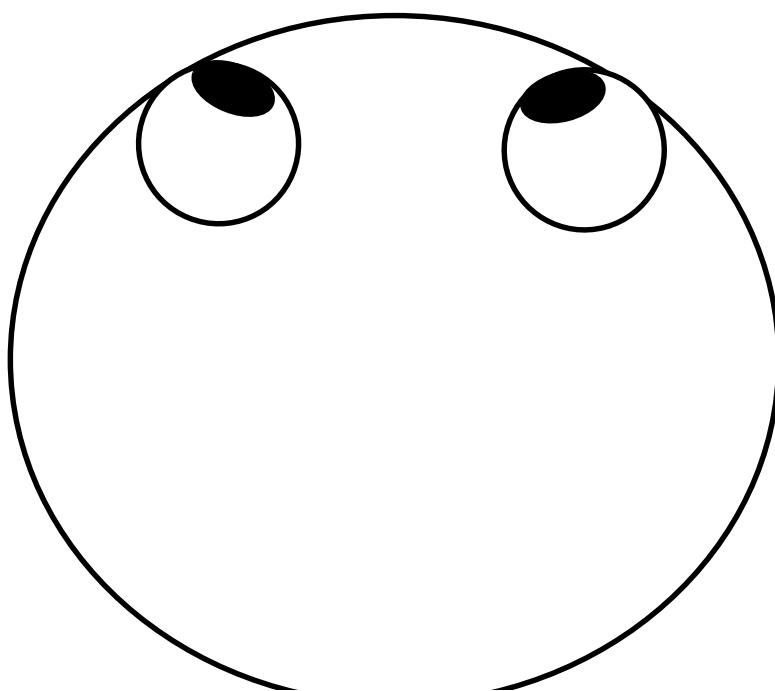

Depth cue(3) 運動視差／Motion Parallax

- When we move...
 - Near: Moves in the opposite direction.
 - Far: Does not move, or moves in the same direction.

Depth cue(4)輻轉／Vergence eye movement

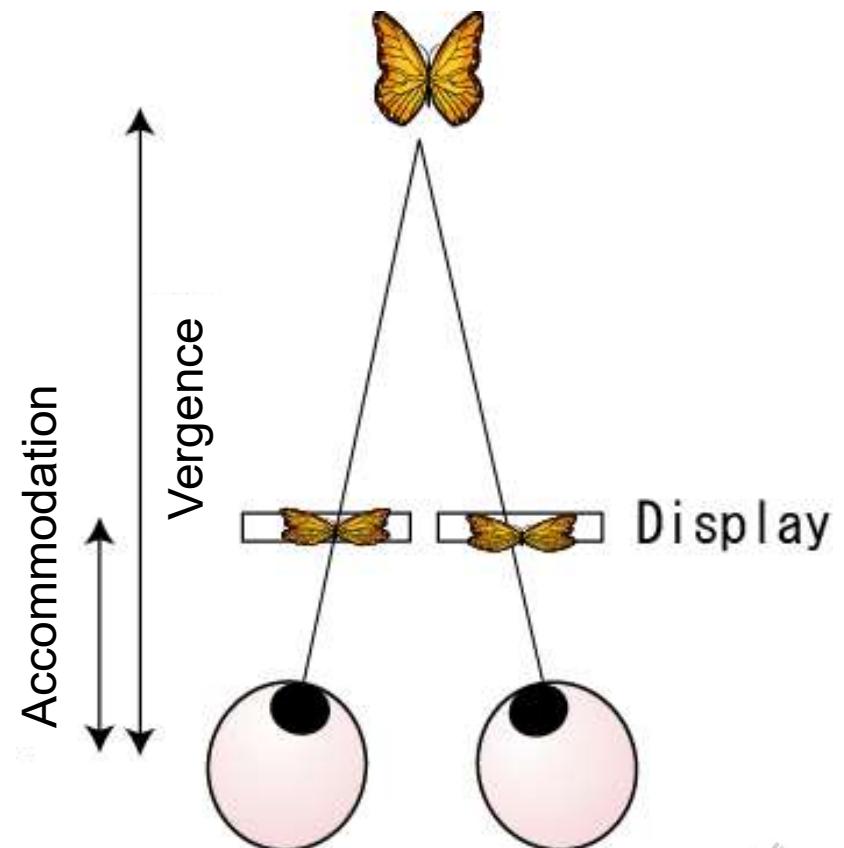

- The eyes converge (move inward) and diverge (move outward) by distance.

輻轉 - 調節矛盾の問題

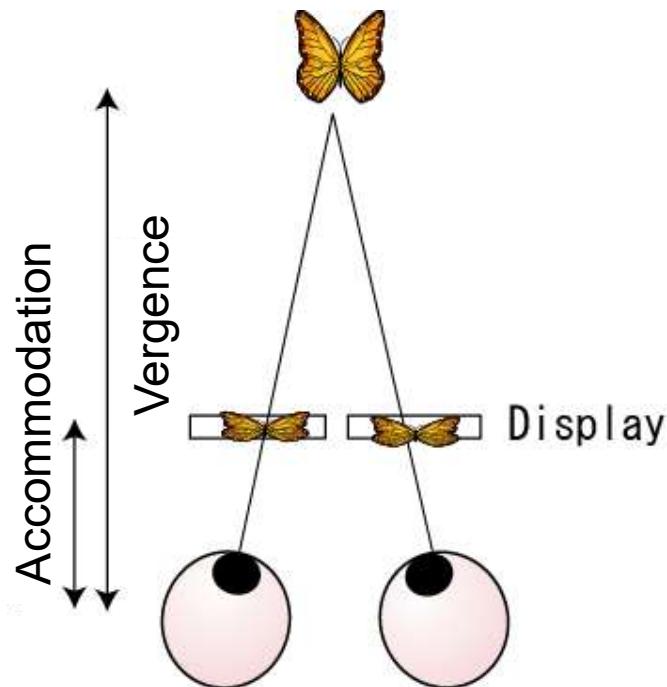

Vergence-accommodation conflicts

- Accommodation & vergence are slightly coupled.
- Stereo display problem:
 - Accomodation=constant
 - Vergence = variable⇒ Severe Fatigue

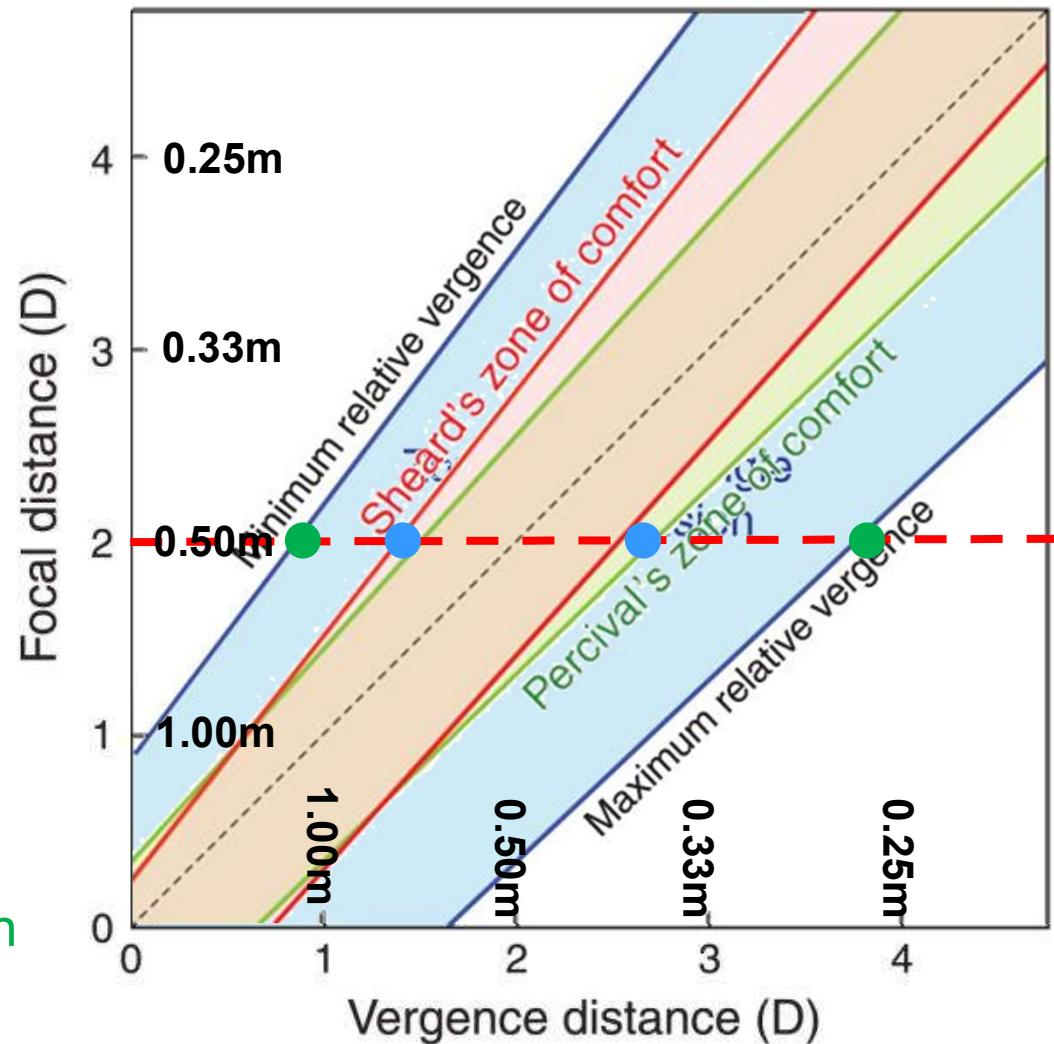

輻轉 - 調節矛盾の許容範囲

Tolerance of vergence-accommodation conflicts

(ex) Physical monitor **0.5m** away from the eyes:

- 0.3m to 1.2m virtual object can be displayed.
- 0.4m to 0.8m virtual object can be **comfortably** displayed.

Modified from: T. Shibata, J. Kim, D.M. Hoffman, M.S. Banks: The zone of comfort: Predicting visual discomfort with stereo displays. J. Vision, 2011, 11(8):11
<https://europemc.org/article/pmc/pmc3369815>

(CHI2016) Novel Optical Configurations for Virtual Reality: Evaluating User Preference and Performance with Focus-tunable and Monovision Near-eye Displays

Robert Konrad, Emily Cooper, Gordon Wetzstein

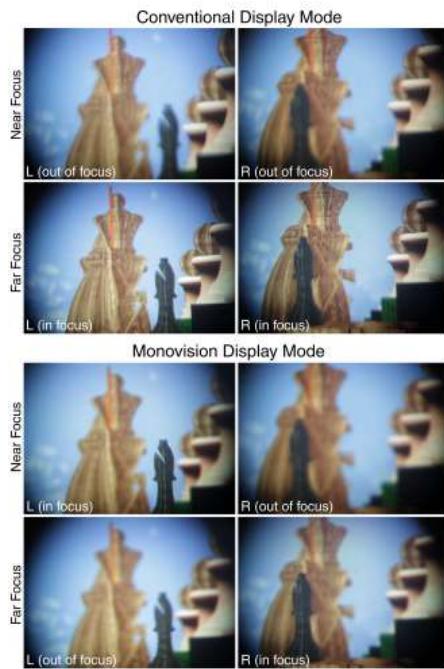

Figure 1. Focus-tunable near-eye display with different rendering modes. In the top panels, we illustrate via photographs how the images seen by each eye in a typical near-eye display are only focused properly when the eyes are focused at a relatively far distance (lower row). When the eyes focus near, to match objects simulated to be near, both eyes' images are blurry (upper row). Monovision is an alternative display mode where the lenses of the two eyes have different focal lengths, allowing for each eye to accommodate at a different distance. The bottom panels illustrate this mode. When the camera is focused relatively far, the left eye's image is out of focus and the right eye's image is sharp (lower row). When the camera is focused near, the relationship reverses. We asked whether this display mode could improve visual comfort and performance.

Novel Optical Configurations for Virtual Reality

Stalker 'found Japanese singer through reflection in her eyes'

© 10 October 2019

f t w Share

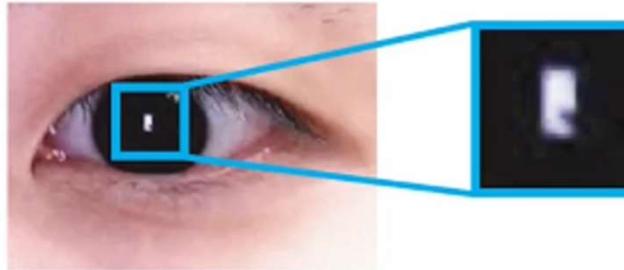

Police say the stalker was able to locate his victim by zooming in on the reflection in her eyes

A Japanese man accused of stalking and sexually assaulting a young pop star told police he located her through the reflection in her eyes in a picture, according to local media reports.

<https://www.bbc.com/news/world-asia-50000234>

眼球運動の種類／Eye movements

- スムーズパースート(滑動性眼球運動)
Smooth Pursuit
 - Follow slow movement of small dots.
Voluntary (conscious)
- サッケード(跳躍性(衝動性)眼球運動)
Saccade
Stepwise movement
 - Motion start is voluntary and involuntary.
 - During motion,
 - You cannot stop (involuntary)
 - Visual acuity drops.
- 固視微動
Miniature eye movement
 - Very small vibration. 30~100Hz.
 - Refresh the image on the retina.
 - Anesthetization of muscles⇒No visual image.

眼球運動の種類／Eye movements

Smooth Pursuit

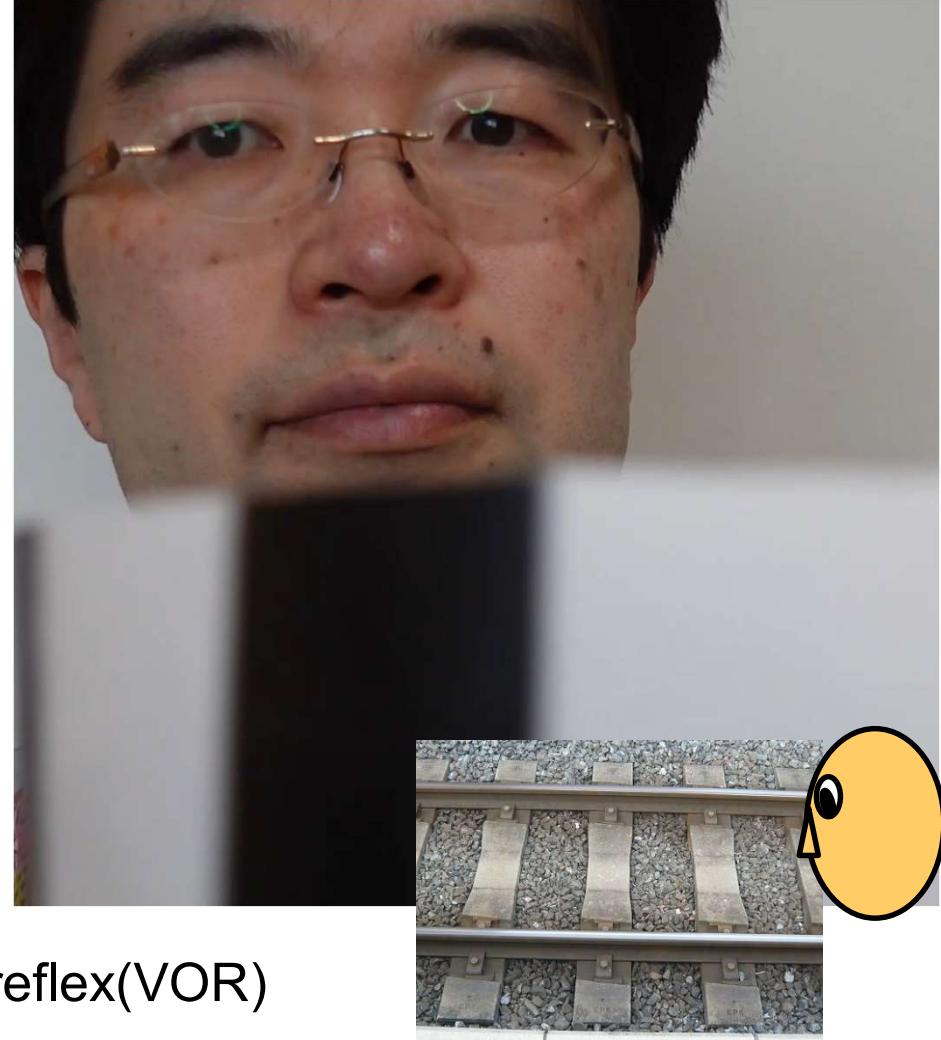

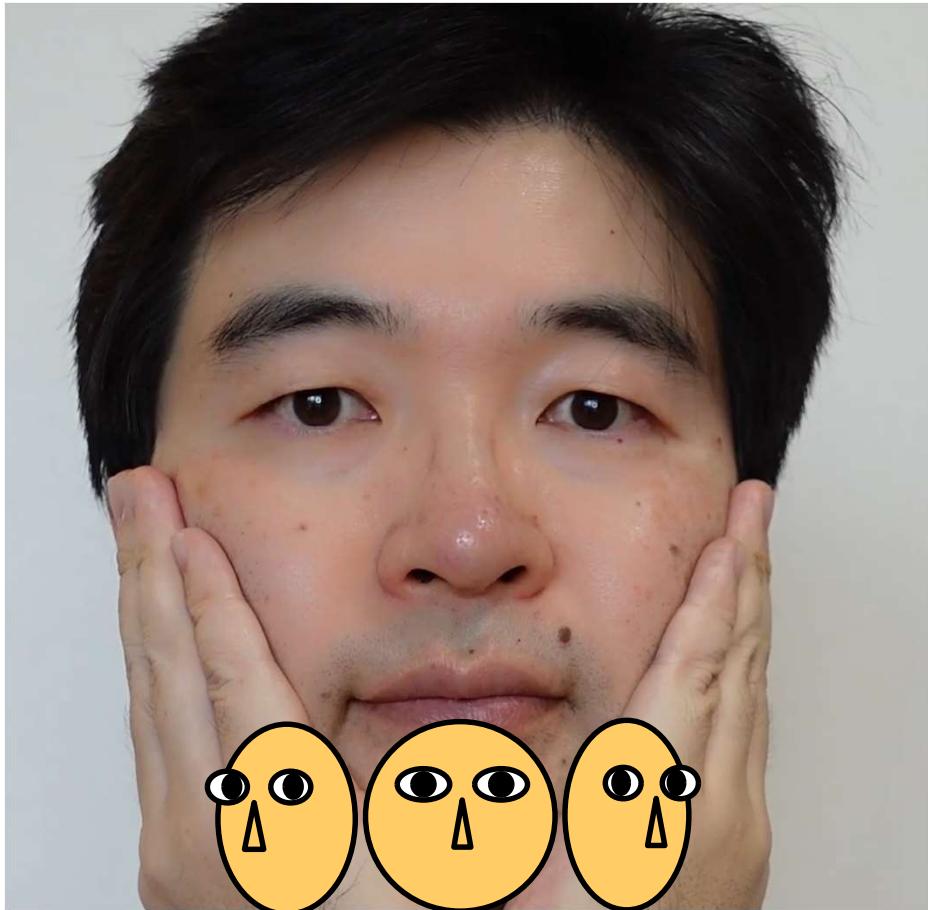

Saccade

安定化のための反射としての眼球運動

Eye movement for stabilization

- 前庭動眼反射／Vestibulo-ocular reflex(VOR)
 - Cancels head rotation.
- 視運動性眼球運動／Optokinetic Response(OKR)
 - When the whole visual field moves, the eye follows.

TODAY's SUMMARY

- 眼の構造／Eye structure
 - cornea, retina, fovea, blind spot
- 眼のセンサ／Eye sensors
 - rod cell, cone cell, color vision
 - peripheral & central vision
 - image processing
- 奥行き知覚／Depth perception
 - accommodation, vergence
 - binocular disparity
- 眼球運動／Eye movement
 - smooth pursuit, saccade,
 - VOR, OKR

小テスト：一週間以内に提出

Mini Test: Submit in one week

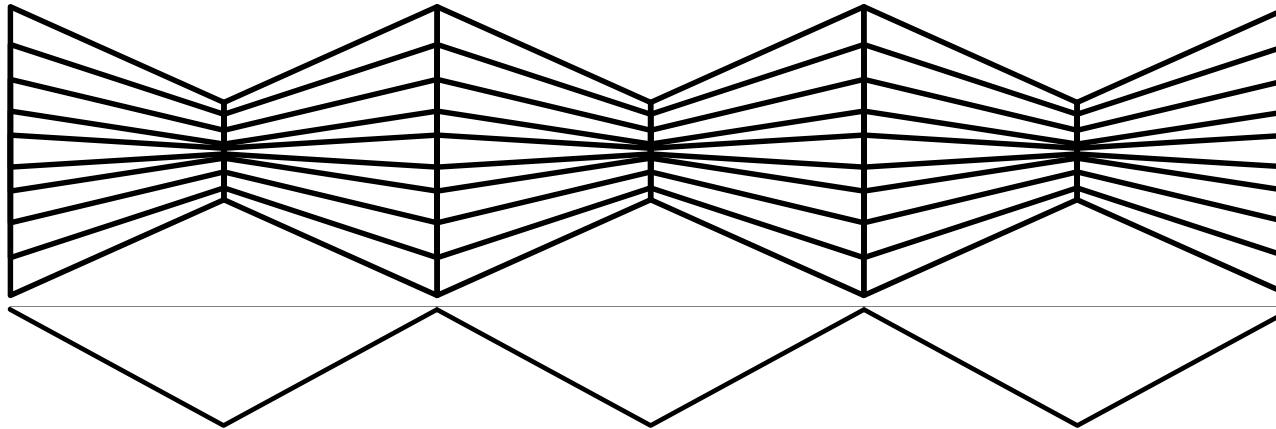

以下の全てに100字以内程度で解答せよ／Answer all questions within 50 words

1. ウエバー・フェヒナーの法則について説明せよ Explain Weber-Fechner's law
2. 調整法について説明せよ Explain the method of adjustment.
3. 極限法について説明せよ Explain the method of limit.
4. 恒常法について説明せよ Explain the method of constant.
5. 錐体細胞と桿体細胞の分布の違いについて述べよ Describe difference of distribution of cone cell and rod cell.
6. 錐体細胞と桿体細胞の明暗および色感受性の違いについて述べよ Describe difference of color and brightness perception of cone cell and rod cell.
7. 焦点調節について説明せよ Explain Accommodation
8. 運動視差について説明せよ Explain Motion Parallax
9. 輻輳について説明せよ Explain Vergence Eye Movement
10. 輻輳調節矛盾について説明せよ Explain Vergence-Accommodation Conflict
11. 両眼視差について説明せよ Explain Binocular Disparity
12. 前庭動眼反射について説明せよ Explain Vestibulo-ocular reflex(VOR)
13. 視運動性眼球運動について説明せよ Explain Optokinetic Response(OKR)
眼底電位計測について説明せよ Explain Electroculography (EOG)
14. 強膜反射法について説明せよ Explain Limbus Tracking Method
15. 角膜反射法について説明せよ Explain Eye Capture System Using Reflection at Horn Coat

実験レポート: pdf形式で一週間以内に提出

Experiment Report: Submit in one week (pdf)

逆遠近錯視(Reverse Perspective Illusion)、ホロウマスク錯視(Hollow Mask Illusion)は、人間の奥行き知覚を利用した錯視である。下記の動画等からその仕組を理解し、どちらか一方を実際に作成すること。オリジナルの絵であることが望ましい。レポートでは実際に作成したものを複数視点から撮影した様子を示すこと。

Reverse Perspective Illusion and Hollow Mask Illusion are illusions based on human depth cues. Understand the mechanism of these illusions from the following movies, etc., and create either one. It is preferable to use your own original drawing. In your report, you should show the actual picture taken from multiple viewpoints.
